Renal cell carcinoma Kazuo; Hida, Shuichi; Okada, Kenichiro; Yoshida, Osamu; Nishimura, Kazumasa (1988). RCC is the most common type of kidney cancer in adults, responsible for approximately 90–95% of cases. "Staging and differential diagnosis of renal cell carcinoma: A comparison Renal cell carcinoma (RCC) is a kidney cancer that originates in the lining of the proximal convoluted tubule, a part of the very small tubes in the kidney that transport primary urine. It is most commonly diagnosed in the elderly (especially in people over 75 years of age). It is more common in men (with a male-to-female ratio of up to 2:1) 7e381b9c1e

Nuclear medicine Single photon emission computed tomography (SPECT) and positron emission tomography (PET) scans are the two most common imaging modalities in nuclear medicine. Nuclear medicine procedures are the major clinical applications of molecular imaging and molecular therapy. Nuclear imaging is, in a sense, radiology done inside out, because it records radiation emitted from within the body rather than radiation that is transmitted through the body from external sources like X-ray generators. In addition, nuclear medicine scans differ from radiology, as the emphasis is not on imaging anatomy, but on the function. The nuclear medicine hepatobiliary scan is clinically useful in the detection of the gallbladder Nuclear medicine (nuclear radiology) is a medical specialty involving the application of radioactive substances in the diagnosis and treatment of disease. technique (3rd column). Normal hepatobiliary scan (HIDA scan). For this reason, it is called a physiological imaging modality 7e381b9c1e

The body is remarkably good at hiding the symptoms and as a result people with RCC often have advanced disease by the time it is discovered. The initial symptoms of RCC often include blood in the urine (occurring in 40% of affected persons at the time they first seek medical attention), flank pain (40%), a mass in the abdomen or flank (25%), weight loss (33%), fever (20%), high blood pressure (20%), night sweats and generally feeling unwell... 7e381b9c1e Due to... 7e381b9c1e

The condition is classified as an inherited metabolic disorder. CAH is an autosomal recessive condition since it results from inheriting two copies of the faulty CYP21A2 gene responsible for 21-hydroxylase enzyme deficiency. The most common forms of CAH are: classical form, usually diagnosed at birth, and nonclassical, late onset form, typically diagnosed during childhood or adolescence, although it can also be identified in adulthood when seeking medical help for fertility concerns or other related issues, such as PCOS or menstrual irregularities. Carriers for the alleles of the nonclassical forms may have no symptoms, such form of CAH is sometimes called cryptic form. Congenital adrenal hyperplasia due to 21-hydroxylase deficiency in all its forms accounts for over 95% of diagnosed cases of all types of congenital adrenal hyperplasia. Unless another specific enzyme is mentioned, CAH in most contexts refers to 21-hydroxylase deficiency. CAH is one of the most common autosomal recessive genetic diseases in humans. 7e381b9c1e

Wikipedia:Administrators' noticeboard/IncidentArchive341 keeps reading inappropriate content onto the RGSAO Wiki page. It will take to long to explain the background (involving schools merging), so I will spare 7e381b9c1e

== Diagnostic medical imaging == 7e381b9c1e Initial treatment is most commonly either partial or complete removal of the affected kidney(s). Where the cancer has not metastasised (spread to other organs) or burrowed deeper into the tissues of the kidney, the five-year survival rate is 65–90%, but this is lowered considerably when the cancer has spread. 7e381b9c1e
