Black Sea Fleet Trevithick, Joseph (June 2020). Following the collapse of the Soviet Union in 1991, the Black Sea Fleet was partitioned between the Russian Federation and Ukraine in 1997, with Russia receiving title to 82% of the vessels. The Black Sea Fleet, along with other Russian ground and air forces on the Crimean Peninsula, are subordinate to the Southern Military District of the Russian Armed Forces. The Russian SFSR inherited the fleet in 1918; with the founding of the Soviet Union in 1922, it became part of the Soviet Navy. The Drive The Black Sea Fleet (Russian: Черноморский флот, romanized: Chernomorskiy flot) is the fleet of the Russian Navy in the Black Sea, the Sea of Azov and the Mediterranean Sea. "Air Force Reveals B-1Bs Were Practicing Decapitating Russia's Black Sea Fleet Last Week". Retrieved 1 October 2020. The fleet traces its history to its founding by Prince Potemkin on 13 May 1783 as part of the Imperial Russian Navy

The drug acts as a non-selective serotonin receptor agonist, including of the serotonin 5-HT_{2A} receptor. It also interacts with dopamine receptors. The compound is a close analogue of LSD that has been modified at the amide to be more rigid and to have three diastereomers. LA-SS-Az, the (S,S)- isomer, is the most potent and similar isomer to LSD, and is the typically employed form of LSZ. LA-SS-Az and the other isomers of LSZ produce psychedelic-like effects in animals.

The Black Sea Fleet has its official primary headquarters and facilities at the Sevastopol Naval Base, Crimea, which Russia annexed from Ukraine in 2014. The rest of the fleet's facilities are based in locations on the Black Sea and the Sea of Azov, including Krasnodar Krai, Rostov Oblast and Crimea.

LSZ was first described in the scientific literature by David E. Nichols and colleagues in 2002. It was developed as a tool for studying psychedelic interactions with the serotonin 5-HT_{2A} receptor and followed the earlier unstable compound LA-Aziridine developed by Nichols and Robert Oberlender. LSZ, under the name "diazedine", may have been produced on a small scale by the LSD manufacturers William

Leonard Pickard and Gordon Todd Skinner around the year 2000. It was first definitely encountered as a novel designer drug in 2013... 5ab52b1b0b

LSZ It is taken orally. certainly ambiguous and could refer to pretty much anything, but I would bet a kilo of benzotriazole-1-yl-oxy-tris-pyrrolidino-phosphonium that LSZ and diazidine LSZ, also known as lysergic acid 2,4-dimethylazetidide or as LA-Azetidide (LA-Az), is a psychedelic drug of the lysergamide family related to lysergic acid diethylamide (LSD) 5ab52b1b0b
