Digestion Digestion is a form of catabolism that is often divided into two processes based on how food is broken down: mechanical and chemical digestion. In chemical digestion, enzymes break down food into the small compounds that the body can use. In certain organisms, these smaller substances are absorbed through the small intestine into the blood stream. The term mechanical digestion refers to the physical breakdown of large pieces of food into smaller pieces which can subsequently be accessed by digestive enzymes. hard for our teeth, such as a chipped plate mixed in food, our teeth send a message to our brain and we realise that it cannot be chewed, so we stop Digestion is the breakdown of large insoluble food compounds into small water-soluble components so that they can be absorbed into the blood plasma. The shell is removed to reveal nibs, which are ground to chocolate liquor (unadulterated chocolate in rough form.) The liquor can be further processed into cocoa butter and cocoa powder, or shaped and sold as unsweetened baking chocolate. By adding sugar, sweetened chocolates are produced, which can be sold simply as dark chocolate, or, with the addition of milk, can be made into milk chocolate. Making chocolate with only cocoa butter and milk produces white chocolate. 88f0517901

It has evolved from shaping soft, native metals like gold with simple hand tools, through the smelting of ores and hot forging of harder metals like iron, up to and including highly technical modern processes such as machining and welding. It has been used as an industry, a driver of trade, individual hobbies, and in the creation of art; it can be regarded as both a science and a craft. 88f0517901 Truck Festival has grown somewhat since its inception, but with an annual attendance of around 30,000 it is dwarfed by the likes of Glastonbury (around 210,000 people) and Reading/Leeds.
