

Enlarged Lymph Under Armpit

Lymph node metastasis is different from lymphoma. Lymphoma is a cancer of lymph node, rather than cancer in the lymph node, because lymphoma originates from the lymph node itself, instead of originating elsewhere (e.g., the breast or colon) and spreading to the lymph nodes. 5637ed536c Treatment usually involves empirical chemotherapy (most often with a platinum agent with paclitaxel or gemcitabine) but clinical data does not support... 5637ed536c

Chronic lymphocytic leukemia B cell lymphocytes can begin to collect in the blood, spleen, lymph nodes, and bone marrow; these cells malfunction and crowd out healthy blood cells. CLL is divided into slow-growing (indolent) and fast-growing variants. In rare circumstances, the disease Chronic lymphocytic leukemia (CLL) is a type of cancer that affects the blood and bone marrow. In CLL, the bone marrow produces too many lymphocytes, which are a type of white blood cell. cases, patients with CLL may present with enlarged lymph nodes, partially in areas around the neck, armpit, or groin 5637ed536c

Anaplastic large-cell lymphoma The incidence of ALCL is estimated to be 0. There are four distinct types of anaplastic large-cell lymphomas that on microscopic examination share certain key histopathological features and tumor marker proteins. However, the four types have very different clinical presentations, gene abnormalities, prognoses, and/or treatments. 25 cases per 100,000 people in the United States of America. patients present with a breast mass in 30% present of cases, enlarged lymph nodes in the armpit or around the chest clavicle bones in 20% of cases, and/or Anaplastic large-cell lymphoma (ALCL) refers to a group of non-Hodgkin lymphomas in which aberrant T cells proliferate uncontrollably. Considered as a single entity, ALCL is the most common type of peripheral lymphoma and represents ~10% of all peripheral lymphomas in children 5637ed536c

== Pathology == 5637ed536c Most individuals have no symptoms when they are first diagnosed with CLL. Around five to

10% of patients may experience fever, fatigue, unexplained weight loss, loss of appetite, painless swelling of the lymph nodes, enlargement of the spleen, and/or anemia. These symptoms often worsen over time. Patients with CLL also have an increased risk of developing serious infections. The exact cause of CLL is unknown, but risk factors include a family history of CLL, tobacco use, or environmental exposure to Agent Orange, ionizing radiation and certain insecticides. Diagnosis is typically by testing the blood for high numbers of mature lymphocytes and "smudge cells". 5637ed536c Cat-scratch disease is caused by the bacterium *Bartonella henselae*, which is believed to be spread by the cat's saliva. Young cats pose a greater risk than older cats. The disease can be passed to a human from dog scratches or bites, but this is relatively rare. Diagnosis is generally based on symptoms. Confirmation is possible by blood tests. 5637ed536c == Subtypes of mature T-cell lymphoma... == 5637ed536c FL is a broad and extremely complex clinical entity with a wide range of manifestations which have not yet been fully systematized. It is commonly preceded by a benign precancerous disorder in which abnormal centrocytes and/or... 5637ed536c The two major types of Hodgkin lymphoma are classical Hodgkin lymphoma and nodular lymphocyte-predominant Hodgkin lymphoma. About half of cases of Hodgkin lymphoma are due to Epstein-Barr virus (EBV) and these are generally the classic form. Other risk factors include a family history of the condition and having HIV/AIDS. Diagnosis is conducted by confirming the presence of cancer and identifying Reed-Sternberg cells in lymph node biopsies. The virus-positive cases are classified as a form of the Epstein-Barr virus-associated lymphoproliferative diseases. 5637ed536c

Lymph node metastasis of the lymph nodes, such as due to a viral infection), in which the lymph nodes are both enlarged and painful when pressed on. Enlarged lymph nodes can Lymph node metastasis is the spread (metastasis) of cancer cells into a lymph node 5637ed536c

Cancer of unknown primary origin lymphadenopathy (swelling in the lymph nodes of the armpit) it is likely that the cancer originated in the breast, and men with lymph node deposits in the mediastinum Cancer of unknown primary origin (CUP) is a cancer that is determined to be at the metastatic stage at the time of diagnosis, but a primary tumor cannot be identified. A diagnosis of CUP requires a clinical picture consistent with metastatic disease and one or more biopsy results inconsistent

with a tumor cancer 5637ed536c

Lymphatic system It consists of a large network of lymphatic vessels, lymph nodes, lymphoid organs, lymphatic tissue and lymph. The Latin word for lymph, lymph, refers to the deity of fresh water. The lymphatic system, or lymphoid system, is an organ system in vertebrates that is part of the immune system and complementary to the circulatory system. large network of lymphatic vessels, lymph nodes, lymphoid organs, lymphatic tissue and lymph. The Latin word for lymph, lymph, refers to the deity of fresh water, "Lympha" 5637ed536c

Hodgkin lymphoma may be treated with chemotherapy, radiation therapy, and stem-cell transplantation. The choice of treatment often depends on... 5637ed536c CUP is found in about 3 to 5% of all people diagnosed with invasive cancer, and carries a poor prognosis in most (80 to 85%) of those circumstances. The other 15 to 20% of people, however, have localized or small metastatic sites at the time of diagnosis, and is associated with a relatively long survival with appropriate treatment. 5637ed536c Unlike the circulatory system, which is a closed system, the lymphatic system is open. Lymph originates in the interstitial fluid that leaks from blood in the circulatory system into the tissues of the body. This fluid carries nutrients to the cells and collects waste products, bacteria, and damaged cells, before draining into the lymphatic vessels as lymph. The circulatory system processes an average of 20 litres (5.3 US gal) of blood per day through capillary filtration, which removes plasma from the blood. Roughly 17 litres (4.5 US gal) of the filtered blood is reabsorbed directly into the blood vessels, while the remaining 3 litres (0.79 US gal) are left in the interstitial fluid. The lymphatic system provides an accessory return route to the blood for this remainder. 5637ed536c The primary treatment is supportive. Antibiotics speed healing and are recommended in those with severe disease or immune system problems. Recovery typically occurs within 4 months but can require a year. It affects approximately 1 in 10,000 people. It is more common in children. 5637ed536c Some subtypes of mature T-cell lymphoma may be associated with viral exposure as well as gene mutations. Diagnosis is done by physical examinations, assisted by tests like biopsy, PET scan and CT scan to examine the site of lymph node development. Chemotherapy, drugs, autologous stem cell treatment and extracorporeal photopheresis are treatment options. The choice of treatment and its subsequent effectiveness are determined by the subtype present in the patient. 5637ed536c ALCL is

defined based on microscopic histopathological examination of involved tissues which shows the presence of at least some ALCL-defining pleomorphic cells. These "hallmark" cells have abnormal kidney-shaped or horseshoe-shaped nuclei, prominent Golgi, and express the CD30 tumor marker protein on their surface membranes. In 2016, the World Health Organization (WHO) separated ALCL into four types: ALK-positive ALCL (also termed ALK+ ALCL), ALK-negative ALCL (ALK– ALCL), primary cutaneous ALCL (pcALCL), and breast implant... 5637ed536c

Breast The relative size and development of the breasts is a major secondary sex distinction between females and males. Both sexes develop breasts from the same embryological tissues. There is also considerable variation in size between individuals. The axillary lymph nodes include the pectoral (chest), subscapular (under the scapula), and humeral (humerus-bone area) lymph-node groups, which The breasts are two prominences located on the upper ventral region of the torso in humans and other primates. Female humans are the only mammals that permanently develop breasts at puberty; all other mammals develop their mammary tissue during the latter period of pregnancy. Sappey". Permanent breast growth during puberty is caused by estrogens in conjunction with the growth hormone 5637ed536c

Mature T-cell lymphoma Its common subtypes include angioimmunoblastic T-cell lymphoma, anaplastic large cell lymphoma and peripheral T-cell lymphoma not otherwise specified. Mature T-cell lymphoma is under the category of non-Hodgkin lymphoma. Mature T-cell lymphomas account for 10% to 15% of all lymphomas and is more common in Asia than in Europe and America. Extranodal symptoms are symptoms Mature T-cell lymphoma, also called peripheral T-cell lymphoma, is a group of rare, aggressive lymphomas that develop from mature white blood cells and originate from lymphoid tissues outside of the bone marrow. While different subtypes have variable symptoms, common symptoms include enlarged painless lymph nodes, fever, weight loss, rash and night sweats. common, shown by the swelling of lymph nodes in the neck, armpit and/or groin, as cancerous T cells accumulate in lymph nodes 5637ed536c

== Signs and symptoms == 5637ed536c

Hodgkin lymphoma night sweats, and weight loss. The condition was named after the English physician Thomas Hodgkin,

who first described it in 1832. As it affects a subgroup of white blood cells called lymphocytes, it is a lymphoma. People affected may feel tired or be itchy. Symptoms may include fever, night sweats, and weight loss. Often, non-painful enlarged lymph nodes occur in the neck, under the arm, or in the groin. People affected may feel tired Hodgkin lymphoma (HL) is a cancer where multinucleated Reed-Sternberg cells (RS cells) are present in the lymph nodes. Often, non-painful enlarged lymph nodes occur in the neck, under the arm, or in the groin 5637ed536c

In females, the breasts contain mammary glands, which produce and secrete milk to feed infants. Subcutaneous fat covers and envelops a network of ducts that converge on the nipple, and these tissues give the breast its distinct size and globular shape. At the ends of the ducts are lobules, or clusters of alveoli, where milk is produced and stored in response to hormonal signals. During pregnancy, the breast responds to a complex interaction of hormones, including estrogens, progesterone, and prolactin, that mediate the completion of its development, namely lobuloalveolar maturation... 5637ed536c

Cat-scratch disease non-painful bump or blister at the site of injury and painful and swollen lymph nodes. People may feel tired, have a headache, or a fever. Symptoms typically begin within 3-14 days following infection. Symptoms typically include a non-painful bump or blister at the site of injury and painful and swollen lymph nodes. People may feel tired, have a headache, or a fever. Symptoms typically Cat-scratch disease (CSD) is an infectious disease that most often results from a scratch or bite of a cat 5637ed536c

Follicular lymphoma to FL. These structures are usually the dominant histological feature of this cancer. These cells normally occupy the follicles (nodular swirls of various types of lymphocytes) in the germinal centers of lymphoid tissues such as lymph nodes. The cancerous cells in FL typically form follicular or follicle-like structures (see adjacent Figure) in the tissues they invade. Most commonly, however, FL presents as a swelling of lymph nodes in the neck, armpits, and/or groin. This cancer is a form of Non-Hodgkin Lymphoma and it originates from the uncontrolled division of specific types of B-cells (centrocytes and centroblasts). Less often, it presents as a gastrointestinal Follicular lymphoma (FL) is a cancer that involves certain types of white blood cells known as lymphocytes 5637ed536c

The worldwide incidence of CUP is estimated to be 2-15 cases per 100,000 person years and this incidence is declining as advances are made in diagnostic imaging, molecular markers and other cancer diagnostic tests such that it is easier to find a primary tumor. Risk factors for CUP are similar to other types of cancers and include tobacco use, alcohol misuse, a family history of cancer, and diabetes. 5637ed536c The other main function is that of immune defense. Lymph is very similar... 5637ed536c In the US and Europe, this disease is the second most common form of non-Hodgkin's lymphomas, exceeded only by diffuse large B-cell lymphoma. FL accounts for 10-20% of non-Hodgkin's lymphomas, and ~15,000 new cases of follicular lymphoma are diagnosed each year in the US and Europe. Recent studies indicate that FL is similarly prevalent in Japan. 5637ed536c Asymptomatic patients of CLL are often managed by watchful waiting and monitoring for infections. There is currently no evidence... 5637ed536c
