

Atrial Fibrillation Atrial Flutter

Atrial flutter But rarely does it persist for months or years. Similar to the abnormal heart rhythm atrial fibrillation, atrial flutter also Atrial flutter (AFL) is a common abnormal heart rhythm that starts in the atrial chambers of the heart. Symptoms may include a feeling of the heart beating too fast, too hard, or skipping beats, chest discomfort, difficulty breathing, a feeling as if one's stomach has dropped, a feeling of being light-headed, or loss of consciousness. into atrial fibrillation (AF). When it first occurs, it is usually associated with a fast heart rate and is classified as a type of supraventricular tachycardia (SVT). Atrial flutter is characterized by a sudden-onset (usually) regular abnormal heart rhythm on an electrocardiogram (ECG) in which the heart rate is fast

Supraventricular tachycardia There are four main types of SVT: atrial fibrillation, atrial flutter, paroxysmal supraventricular tachycardia (PSVT), and Wolff-Parkinson-White. chambers of the heart

Dronedarone recommended as an alternative to amiodarone for the treatment of atrial fibrillation and atrial flutter in people whose hearts have either returned to normal rhythm

Premature atrial contraction In otherwise healthy people, PACs usually disappear with. problems, PACs can trigger a more serious arrhythmia such as atrial flutter or atrial fibrillation

Although this abnormal heart rhythm typically occurs in individuals with cardiovascular disease (e.g., high blood pressure, coronary artery disease, and cardiomyopathy) and diabetes mellitus, it may occur spontaneously in people with otherwise normal hearts. It is typically not a stable rhythm and often degenerates into atrial fibrillation (AF). But rarely does it persist for months or years. Similar to the abnormal heart rhythm atrial fibrillation, atrial flutter also leads to poor contraction of the atrial chambers of the heart. This leads to the pooling of the blood...

Ibutilide It exerts its antiarrhythmic. antiarrhythmic agent that is indicated for acute cardioconversion of atrial fibrillation and atrial flutter of a recent onset to sinus rhythm

Multifocal atrial tachycardia regular PP intervals and flutter waves), atrial fibrillation (this would not have discrete P-wave morphologies), and wandering atrial pacemaker which would

Atrial tachycardia Paroxysmal atrial tachycardia (PAT) is an episode of arrhythmia that begins and ends abruptly. Atrial tachycardia. focal atrial tachycardia and atrial flutter

Atrial fibrillation Atrial fibrillation (AF, AFib or A-fib) is an abnormal heart rhythm (arrhythmia) characterized by rapid and irregular beating of the atrial chambers of

Familial atrial fibrillation Familial atrial fibrillation is an autosomal dominant heart condition that causes disruptions in the heart's normal rhythm. This condition is characterized

Catheter ablation who are prone to developing cardiac arrhythmias such as atrial fibrillation, atrial flutter and Wolff-Parkinson-White syndrome. If not controlled, such
