

# Vertical Ridges In Fingernails

Clinically, the diagnosis of any particular skin condition begins by gathering pertinent information of the presenting skin lesion(s), including: location (e.g. arms... f83a84c02a == Origins == f83a84c02a == Structure == f83a84c02a

Nail disease commonly seen in the great toe but may be seen in other toes as well as the fingernails. Some nail conditions that show signs of infection or inflammation may require medical assistance. Although the nail is a structure produced by the skin and is a skin appendage, nail diseases have a distinct classification as they have their own signs and symptoms which may relate to other medical conditions. An affected nail has many grooves and ridges, is brownish in color, A nail disease or onychosis is a disease or deformity of the nail f83a84c02a

Conditions of the human integumentary system constitute a broad spectrum of diseases, also known as dermatoses, as well as many nonpathologic states (like, in certain circumstances, melanonychia and racquet nails). While only a small number of skin diseases account for most visits to the physician, thousands of skin conditions have been described. Classification of these conditions often presents many nosological challenges, since underlying causes and pathogenetics are often not known. Therefore, most current textbooks present a classification based on location (for example, conditions of the mucous membrane), morphology (chronic blistering conditions), cause (skin conditions resulting from physical factors), and so on. f83a84c02a In 2000, the Association of Zoos and Aquariums in the US upgraded the bongo to a Species Survival Plan participant and in 2006 added the Bongo Restoration to Mount Kenya Project to its list of the Top Ten Wildlife Conservation Success Stories of the year. As of 2013, these successes have been compromised by reports of possibly only 100 mountain bongos left in the wild due to logging and poaching. f83a84c02a

Bongo (antelope) Bongos have complex social interactions and are found in African dense forest mosaics. the outer layer of the horn is made of keratin, the same material in human fingernails, toenails, and hair. The bongo runs gracefully and at full speed The bongo (*Tragelaphus eurycerus*) is a large, mostly nocturnal, forest-dwelling antelope, native to sub-Saharan Africa. They are the third-largest antelope in the world. Bongos are characterised by a striking reddish-brown coat, black-and-white markings, white-yellow stripes, and long, slightly spiraled horns f83a84c02a

Knuckleball Umpires are challenged as well, as the ball's irregular motion through the air makes it harder to call balls and strikes. This grip can also include digging the fingernails into the surface of the ball. This makes it difficult for batters to hit but also difficult for pitchers to control and catchers to catch. A pitcher who throws

knuckleballs is known as a knuckleballer. The fingertip grip is more commonly used. A knuckleball or knuckler is a baseball pitch thrown to minimize the spin of the ball in flight, causing an erratic, unpredictable motion. While it is often incorrectly stated that the air flow over a seam of the ball causes the ball to change from laminar to turbulent flow, it has been recently shown that turbulence transition would cause the ball to move in the opposite direction as it does. being held with the knuckles. At the same time, this detachment alters the shear stress on the ball, causing the seam positions to move. Instead, the seam causes the boundary layer to detach, altering the pressure distribution and the force on the ball.

**Skin condition** The superficial papillary dermis interdigitates with the overlying rete ridges of the epidermis, between which the two layers interact through the basement membrane. A skin condition, also known as a cutaneous condition, is any medical condition that affects the integumentary system—the organ system that encloses the body and includes skin, nails, and related muscle and glands. The major function of this system is to act as a barrier against the external environment.

Beau's lines distinguished from Muehrcke's lines of the fingernails. While Beau's lines are actual ridges and indentations in the nail plate, Muehrcke lines are areas where Beau's lines are deep grooved lines that run from side to side on the fingernail or the toenail. They may look like indentations or ridges in the nail plate.

Bowed instruments include the string section instruments of the orchestra in Western classical music (violin, viola, cello and double bass) and a number of other instruments (e.g., viols and gambas used in early music from the Baroque music era and fiddles used in many types of folk music). All of the bowed string instruments can also be plucked with the fingers, a technique... As the nail grows out, the ridge in the nail can be seen to move upwards until it reaches the fingertip. When it reaches this point the fingertips can become sore for a few days as the nail bed is exposed by the...

Summer Island Site vertical finger-trailed lines applied from the neck to the shoulder of the vessel. It is classified as a stratified, multi-component site with Middle Woodland (c. 100 B. 1000–1500 A. D. Pottery similar to this type has been recorded at other sites in Wisconsin. The Summer Island Site, designated 20DE4, is an archaeological site located on the northwest side of Summer Island, in Delta County, Michigan. ) and Early Historic/Protohistoric occupations (c. 1500–1700). It was listed on the National Register of Historic Places in 1971.

It was released on 1 December 2017, by Vertical Entertainment.

**Plate tectonics** Plate tectonics came to be accepted by geoscientists after seafloor

spreading was validated in the mid- to late 1960s. 3 in/year) for the Nazca Plate tectonics (from Latin tectonicus, from Ancient Greek τεκτονικός (tektonikós) 'pertaining to building') is the scientific theory that Earth's lithosphere comprises a number of large tectonic plates, which have been slowly moving since 3–4 billion years ago. year (0. 4 to 1. The model builds on the concept of continental drift, an idea developed during the first decades of the 20th century. The processes that result in plates and shape Earth's crust are called tectonics. 6 in/year) at the Mid-Atlantic Ridge (about as fast as fingernails grow), to about 160 millimetres per year (6 f83a84c02a

Musicians play some string instruments, like guitars, by plucking the strings with their fingers or a plectrum (pick), and others by hitting the strings with a light wooden hammer or by rubbing the strings with a bow, like violins. In some keyboard instruments, such as the harpsichord, the musician presses a key that plucks the string. Other musical instruments generate sound by striking the string. f83a84c02a == Taxonomy == f83a84c02a

String instrument used to sound notes on the electric guitar, including plucking with the fingernails or a plectrum, strumming and even &quot;tapping&quot; on the fingerboard and using In musical instrument classification, string instruments, or chordophones, are musical instruments that produce sound from vibrating strings when a performer strums, plucks, strikes or sounds the strings in varying manners f83a84c02a

== Plot == f83a84c02a This condition of the nail was named by a French physician, Joseph Honoré Simon Beau (1806–1865), who first described it in 1846. f83a84c02a The origins of the knuckleball are unclear. Toad Ramsey of the Louisville Colonels in the American Association—whose pitch likely resembled the knuckle curve—and Eddie Cicotte of the Chicago White Sox, who in 1908 was nicknamed "Knuckles", are two possible creators of the... f83a84c02a == Signs and symptoms == f83a84c02a

Slumber (film) It stars Maggie Q, Kristen Bush, Sam Troughton, Will Kemp, William Hope and Sylvester McCoy. and erratic at night, mumbling in his sleep and waking up in different parts of the house, often with bloody fingernails as if he's been clawing at something Slumber is a 2017 British supernatural horror-thriller film directed by Jonathan Hopkins and co-written by Richard Hobley and Hopkins f83a84c02a

Tectonic plates are composed of the oceanic lithosphere and the... f83a84c02a == Site description == f83a84c02a

Lacrimal bone A depression on the anterior inferior portion of one bone, the lacrimal fossa, houses the membranous lacrimal sac. bone can result in posttraumatic obstruction of the lacrimal pathways. This drainage results in what is commonly referred to a runny nose during excessive crying or tear production. The fluid then flows through the nasolacrimal duct and into the nasopharynx. Injury or fracture of the

lacrimal bone can result in posttraumatic obstruction of the lacrimal pathways. Tears, from the lacrimal glands, collect in this sac during excessive lacrimation. Specifically, the lacrimal bones help form the nasolacrimal canal necessary for tear translocation. Several bony landmarks of the lacrimal bones function in the process of lacrimation. They each have two surfaces and four borders. The lateral or orbital surface is divided by a vertical ridge, the posterior lacrimal. The lacrimal bones are two small and fragile bones of the facial skeleton; in humans, they are roughly the size of the little fingernail and situated at the front part of the medial wall of the orbit f83a84c02a

Earth's lithosphere, the rigid outer shell of the planet including the crust and upper mantle, is fractured into seven or eight major plates (depending on how they are defined) and many minor plates or "platelets". Where the plates meet, their relative motion determines the type of plate boundary (or fault): convergent, divergent, or transform. The relative movement of the plates typically ranges from zero to 10 cm annually. Faults tend to be geologically active, with earthquakes, volcanic activity, mountain-building, and oceanic trench formation. f83a84c02a Beau's lines should also be distinguished from Muehrcke's lines of the fingernails. While Beau's lines are actual ridges and indentations in the nail plate, Muehrcke lines are areas of hypopigmentation without palpable ridges; they affect the underlying nail bed, and not the nail itself. Beau's lines should also be distinguished from Mees' lines of the fingernails, which are areas of discoloration in the nail plate. f83a84c02a Beau's lines are horizontal, going across the nail, and should not be confused with vertical ridges going from the bottom (cuticle) of the nail out to the fingertip. These vertical lines are usually a natural consequence of aging and are harmless. f83a84c02a With bowed instruments, the player pulls a rosined horsehair bow across the strings, causing them to vibrate. With a hurdy-gurdy, the musician cranks a wheel whose rosined edge touches the strings. f83a84c02a
