== Signs and symptoms == 11fbbc43d2 In the human embryo, the arches are first seen during the fourth week of development. They appear as a series of outpouchings of mesoderm on both sides of the developing pharynx. The vasculature of the pharyngeal arches are the aortic arches that arise from the aortic sac. 11fbbc43d2 The gills of some semi-aquatic clades (e.g. crabs, terrestrial hermit crabs and amphibious fishes), have also adapted to allow air respiration (breathing) on land provided the gills are kept moist. In some terrestrial chelicerates species (tetrapulmonates such as spiders and scorpions), their ancestral gills have evolved into fully air-breathing book lungs. In some planktivorous bony fish species (e.g. silver and bighead carps), the gills are also used as a filter feeding organ via comb-like projections called gill rakers. 11fbbc43d2 The microscopic structure of a gill presents a large surface area in contact with the external environment, which allows optimal diffusion. With the exception of some aquatic insects, the gills of aquatic animals have filaments and lamellae (folds) that contain blood vessels or coelomic fluid, from which gases are exchanged into and out of blood/hemolymph through the thin gill walls before being... 11fbbc43d2 == Early life and education == 11fbbc43d2 In the 1980s, Ness was the original renter of the one-bedroom apartment described in the Adolescents song "Kids of the Black Hole... 11fbbc43d2 The malformation is named after the Austrian pathologist Hans Chiari. In humans and other vertebrates, the pharyngeal arches are derived from all three germ layers, (the primary layers of cells that form during embryonic development). Neural crest cells enter these arches where they contribute to features of the skull and facial skeleton such as bone and cartilage. The existence of pharyngeal structures before neural crest cells evolved is indicated by the existence of neural crest-independent mechanisms of pharyngeal arch development. 11fbbc43d2 Ness was born in Stoneham, Massachusetts on April 3, 1962. His family relocated to Orange County, California, later that year, and he grew up in Fullerton. As a child, he idolized gangsters such as John Dillinger and Bonnie and Clyde. Less often, people may experience ringing or buzzing in the ears, weakness, slow heart rhythm, fast heart rhythm, curvature of the spine (scoliosis) related to spinal cord impairment, abnormal breathing such as in central sleep apnea, and, in severe cases, paralysis. CM can sometimes lead to non-communicating hydrocephalus as a result of obstruction of cerebrospinal fluid (CSF) outflow. The CSF outflow is caused by phase difference in outflow and influx of blood in the vasculature of the brain. 11fbbc43d2 == Signs and symptoms == 11fbbc43d2 == Structure == 11fbbc43d2 In humans, two sets of pharyngeal muscles form the pharynx and determine the shape of its lumen. They are arranged as an inner layer of longitudinal muscles, and an outer circular layer 11fbbc43d2 In humans, the pharynx is part of the digestive system and the conducting zone of the respiratory system. (The conducting zone—which also includes the nostrils of the nose, the larynx, trachea, bronchi, and bronchioles—filters, warms, and moistens air and conducts it into the lungs). The human pharynx is conventionally divided into three sections: the nasopharynx, oropharynx, and laryngopharynx (hypopharynx). 11fbbc43d2

Pharyngeal arch gills; in tetrapods the anterior arches develop into components of the ear, tonsils, and thymus. In fish, the arches support the gills and are known as the branchial arches, or gill arches.
