[Pharmaceutical packaging](#) is highly regulated but with some variation in the details, depending on the country of origin or the region. Several common factors can include: assurance of patient safety, assurance of the efficacy of the drug through the intended shelf life, uniformity of the drug through different production lots, thorough documentation of all materials and processes, control of possible migration of packaging components into the drug, control of degradation of the drug by oxygen, moisture, heat, light exposure etc., prevention of microbial contamination, sterility, etc. Packaging is often involved in dispensing, dosing, and use of the pharmaceutical product. Communication of proper use and cautionary labels are also regulated. Packaging is an integral part of pharmaceutical product. [Pharmaceutical packaging](#)

Early use of pessaries dates back to the ancient Egyptians, as they described using pessaries to treat pelvic organ prolapse. The term 'pessary' itself is derived from the Ancient Greek word pessós, meaning round stone used for games. [Early use of pessaries](#)

Anal plug This plug may remain inside the rectum for up to 12 hours An anal plug (anal tampon or anal insert) is a medical device that is often used to treat fecal incontinence, the accidental passing of bowel moments, by physically blocking involuntary loss of fecal material. Fecal material such as feces are solid remains of food that does not get digested in the small intestines; rather, it is broken down by bacteria in the large intestine. Anal plugs vary in design and composition, but they are typically single-use, intra-anal, disposable devices made out of soft materials to contain fecal material and prevent it from leaking out of the rectum. cord to tug on for removal. It comes in two sizes, and is inserted similarly to a suppository. The idea of an anal insert for fecal incontinence was first evaluated in a study of ten participants with three different designs of anal inserts [Anal plug](#)

Diaphragm (birth control) Fitting by a healthcare provider is generally required. It is placed over the cervix with spermicide before sex and left in place for at least six hours after sex. Medicines. The rim of a diaphragm The diaphragm is a barrier method of birth control. It is moderately effective, with a one-year failure rate of around 12% with typical use. Before inserting or removing a diaphragm, one's hands should be washed to avoid introducing harmful bacteria into the vaginal canal [Diaphragm \(birth control\)](#)

Rectum It terminates at the level of the anorectal ring (the level of the puborectalis sling) or the dentate line, again depending upon which definition is used. Before expulsion through the anus or cloaca, the rectum stores the feces temporarily. By their definitions, suppositories are inserted, and enemas are injected into the rectum. In humans, the rectum is followed by the anal canal, which is about 4 centimetres (1. The adult human rectum is about 12 centimetres (4. administered via the rectum (Latin: per rectum). Its diameter is similar to that of the sigmoid colon at its commencement, but it is dilated near its termination, forming the rectal ampulla. Medications The rectum (pl. [Less commonly](#), rectal microbicides can have other purposes also; for example, they could be used to treat certain medical conditions as a suppository would. [Pessaries](#) come in different shapes and sizes, so it is important that individuals be fitted for them by health care professionals to avoid any complications. However, there are a few instances and circumstances that allow pessaries to be purchased without a prescription or without seeking help from a health care professional. Some side effects may occur if pessaries are not sized properly or regularly maintained, but with the appropriate care, pessaries are generally safe and well tolerated. [Structure](#) [Side effects](#) are usually very few. Use may increase the risk of bacterial vaginosis and urinary tract infections. If left in the vagina for more than 24 hours toxic shock syndrome may occur. While use may decrease the risk of sexually transmitted infections, it is not very effective at doing so. There are a number of types of diaphragms with different rim and spring designs. They may be made from latex, silicone, or natural rubber. They work by blocking access to and holding spermicide near the cervix. [Diaphragm \(birth control\)](#)

Dry enema due to the relative hardness of the suppository – necessary for its insertion into the human body – before glycerin can act, it must be melted by the heat A dry enema is an alternative technique for cleansing the human rectum either for reasons of health, or for sexual hygiene. It is accomplished by squirting a small amount of sterile lubricant into the rectum, resulting in a bowel movement more quickly and with less violence than can be achieved by an oral laxative fda7ee5e77
