Refrigeration In 1873 Refrigeration is the artificial cooling of a space, substance, or system to lower and/or maintain its temperature below the ambient temperature. Refrigeration has many applications, including household refrigerators, industrial freezers, cryogenics, and cool store air conditioning. Early refrigeration uses consumable coolants such as ice and dry ice (which are procured through separate means and need periodic replenishing), while modern refrigeration is a self-sustaining heat exchanger process by which thermal energy is transferred against the temperature gradient via the use of a heat-transfer working fluid (also known as refrigerant), which absorbs heat from a low-temperature medium and releases it to another higher-temperature medium, typically involving active phase change via a compressor and aided by a radiator system. were in operation. Energy transfer in refrigeration is traditionally driven by physical means (whether ice melting or an electromechanical machine driving the heat exchanger), but it can also be driven by heat pump, magnetism, electricity, laser cooling, or other means. He later entered the debate of how to compete against the American advantage of unrefrigerated beef sales to the United Kingdom. Heat pumps may make use of the heat output of the refrigeration process (such as for water heating), and also may 63137496ee
