

Vertical Lines On Nails

In research on depth vision, the term stereopsis is primarily used for binocular depth vision and not for the sensation of depth resulting from motion vision. Sometimes the term "relative depth" is used. This term emphasizes that it refers not to the distance to the observer, but to the mutual depth relationships of the perceived objects. If the meaning is clear from the context, the single word "depth" is also used instead... Odd24375c1 == Background == Odd24375c1 The bed of nails consists of a field of 2-metre (7 ft) long steel rebars rising vertically out of the ground in a pattern in front of the silo to be defended. Warheads aimed at missile silos will hit at least one of the rebars before hitting the ground, potentially destroying the warhead before it can trigger. The pebble fan is a similar concept consisting of a long strip of gunpowder topped with steel balls which would be triggered to fly into the air and produce a "curtain" of pellets. Odd24375c1 Beau's lines should also be distinguished from Muehrcke's lines of the fingernails. While Beau's lines are actual ridges and indentations in the nail plate, Muehrcke lines are areas of hypopigmentation without palpable ridges; they affect the underlying nail bed, and not the nail itself. Beau's lines should also be distinguished from Mees' lines of the fingernails, which are areas of discoloration in the nail plate. Odd24375c1 The question of the survivability of the Minuteman missile force was repeatedly raised by the Department of Defense (DOD)... Odd24375c1 == Signs and symptoms == Odd24375c1

Bed of nails defense The bed of nails consists of a field of 2-metre (7 ft) long steel rebars rising vertically out of the ground in a pattern in front The bed of nails defense and the related pebble fan defense are anti-ballistic missile concepts intended to defend missile silos against attack. missile silos against attack Odd24375c1

Electrical wires and cables are routed overhead on utility poles as an inexpensive way to keep them insulated from the ground and out of the way of people and vehicles. Utility poles are usually made out of wood, aluminum alloy, metal, concrete, or composites like fiberglass. A Stobie pole is a multi-purpose pole made of two steel joists held apart by a slab of concrete in the middle, generally found in South Australia. Odd24375c1 == Signs and symptoms == Odd24375c1

Framing (construction) Studs are at least doubled Framing, in construction, is the fitting together of pieces to give a structure, particularly a building, support and shape. are used without framing. top and bottom plates are end-nailed to each stud with two nails at least 3+1/4 in (83 mm) in length (16d or 16-penny nails). Framing materials are usually wood, engineered wood, or structural steel. The alternative to framed construction is generally called mass wall construction, where horizontal layers of stacked materials such as log building, masonry, rammed earth, adobe, etc Odd24375c1

Nail disease The normal process of change is: brittle nails, straight nails, spoon-shaped A nail disease or onychosis is a disease or deformity of the nail. when the nail curves upwards (becomes spoon-shaped) due to an iron deficiency. Some nail conditions that show signs of infection or inflammation may require medical assistance. Although the nail is a structure produced by the skin and is a skin appendage, nail diseases have a distinct classification as they have their own signs and symptoms which may relate to other medical conditions Odd24375c1

Beau's lines are horizontal, going across the nailline, and should not be confused with vertical ridges going from the bottom (cuticle) of the nail out to the fingertip. These vertical lines are usually a natural consequence of aging and are harmless. Odd24375c1 Building framing is divided into two broad categories, heavy-frame construction (heavy framing) if the vertical supports are few and heavy such as in timber framing, pole building framing, or steel framing; or light-frame construction (light-framing) if the supports are more numerous and smaller, such as balloon, platform, light-steel framing and pre-built framing. Light-frame construction using standardized dimensional lumber has become the dominant construction method in North America and Australia due to the economy of the method; use of minimal structural material allows builders to enclose a large area at minimal cost while achieving a wide variety of architectural styles. Odd24375c1

Stereopsis 1980;9(6):651-69 In the science of visual perception, stereopsis is the sensation that objects in space extend into depth, and that objects have different distances from each other. Krol JD, van de Grind WA (1989),"The double-nail illusion, experiments on binocular vision with nails needles and pins", Perception. This sensation is much stronger than the suggestion of depth that is created by two-dimensional perspective Odd24375c1

Although neither system is wholly effective, compared with other missile defenses they cost very little to build, and are effective enough to increase the number of failed attacks and thus demand a larger number of warheads be expended in any attack on the silo - leaving the attacker fewer warheads to use on other targets. Moreover, the results of a counterforce attack would be much less predictable, making such an attack less valuable. Odd24375c1 As the nail grows out, the ridge in the nail can be seen to move upwards until it reaches the fingertip. When it reaches this point the fingertips can become sore for a few days as the nail bed is exposed by the... Odd24375c1 == Methods == Odd24375c1 The first poles were used in 1843 by telegraph pioneer William Fothergill Cooke, who used them on a line along the Great Western Railway. Utility poles were first used in the... Odd24375c1 This condition of the nail was named

by a French physician, Joseph Honoré Simon Beau (1806–1865), who first described it in 1846. Odd24375c1

Shoring Shoring comes from shore, a timber or metal prop. In this method, inclined members called rakers Shoring is the process of temporarily supporting a building, vessel, structure, or trench with shores (props) when in danger of collapse or during repairs or alterations. Shoring comes from shore, a timber or metal prop. alterations. Shoring may be vertical, angled, or horizontal. Shoring may be vertical, angled, or horizontal Odd24375c1

Modern light-frame structures usually gain strength from rigid panels (plywood and other plywood-like composites... Odd24375c1 The passing of time can be observed by placing a stick in the sand or a nail in a board and placing markers... Odd24375c1 Habit-tic deformity is recognizable for its horizontal ridges that create a fir-tree shape. Discoloration along the affected area of the nail is also common. The condition is not to be confused with median nail dystrophy, a similar but rarer condition which additionally includes a canal-like vertical ridge. The deformity is most commonly seen on the thumbs, but is also less commonly seen on other nails. Odd24375c1 == Diseases == Odd24375c1

Utility pole The vertical space on the pole A utility pole, commonly referred to as a transmission pole, telephone pole, telecommunication pole, power pole, hydro pole, telegraph pole, or telegraph post, is a column or post used to support overhead power lines and various other public utilities, such as electrical cable, fiber optic cable, and related equipment such as transformers and street lights while depending on its application. distribution lines and associated equipment are mounted at the top of the pole above the communication cables, for safety. They are used for two different types of power lines: sub transmission lines, which carry higher voltage power between substations, and distribution lines, which distribute lower voltage power to customers Odd24375c1

Sundial The gnomon casts a broad shadow; the shadow of the style shows the time. The gnomon may be a rod, wire, or elaborately decorated metal casting. has a vertical gnomon and hour markers positioned in an elliptical pattern. The style's angle from horizontal is equal to the sundial's geographical latitude. The style is the time-telling edge of the gnomon, though a single point or nodus may be used. There are no hour lines on the dial and the time of day is read on the ellipse A sundial is a horological device that tells the time of day (referred to as civil time in modern usage) when direct sunlight shines by the apparent position of the Sun in the sky. In the narrowest sense of the word, it consists of a flat plate (the dial) and a gnomon, which casts a shadow onto the dial. As the Sun appears to move through the sky, the shadow aligns with different hour-lines, which are marked on the dial to indicate the time of day. The style must be parallel to the axis of the Earth's rotation for the sundial to be accurate throughout the year Odd24375c1

In humans, at least two mechanisms produce the sensation of stereopsis: binocular depth vision and (monocular) motion vision. In binocular depth vision, the sensation arises from processing differences in retinal images resulting from the two eyes looking from different, but similar, directions (binocular disparity). In motion vision, the sensation arises from processing motion information when the observer moves (e.g. optical flow, parallax). The sensation of stereopsis is similar in both cases. Odd24375c1 The term sundial can refer to any device that uses the Sun's altitude or azimuth (or both) to show the time. Sundials are valued as decorative objects, metaphors, and objects of intrigue and mathematical study. Odd24375c1

Beau's lines These vertical lines are usually a natural consequence Beau's lines are deep grooved lines that run from side to side on the fingernail or the toenail. They may look like indentations or ridges in the nail plate. should not be confused with vertical ridges going from the bottom (cuticle) of the nail out to the fingertip Odd24375c1

Habit-tic deformity The condition is characterized by ridges which run horizontally across the entire nail, most often occurring on the thumbs, as well as marked damage to or absence of cuticles. includes a canal-like vertical ridge. The deformity is most commonly seen on the thumbs, but is also less commonly seen on other nails. Habit-tic deformity Habit-tic deformity is a condition of the nail caused by external trauma to the nail matrix Odd24375c1

Parallel Lines In Billboard magazine, Parallel Lines was listed at No. An instant critical and commercial success, the album reached No. An instant critical and commercial Parallel Lines is the third studio album by American rock band Blondie, released on September 8, 1978, by Chrysalis Records. The album spawned several successful singles, notably the international hit "Heart of Glass". Parallel Lines is the third studio album by American rock band Blondie, released on September 8, 1978, by Chrysalis Records. 9 in its top pop albums year-end chart of 1979. 6 on the Billboard 200 in April 1979. 1 on the UK Albums Chart in February 1979 and proved to be the band's commercial breakthrough in the United States, where it reached No Odd24375c1
