

Which Graph Represents A Function

Graph drawing the graph is planar, then it is often convenient to draw it without any edge intersections; that is, in this case, a graph drawing represents a graph embedding f85da6f288

Graph (discrete mathematics) In discrete mathematics, particularly in graph theory, a graph is a structure consisting of a set of objects where some pairs of the objects are in some f85da6f288

Distance (graph theory) mathematical field of graph theory, the distance between two vertices in a graph is the number of edges in a shortest path (also called a graph geodesic) connecting f85da6f288

The term reliability function is common in engineering while the term survival function is used in a broader range of applications, including human mortality. The survival function is the complementary cumulative distribution function of the lifetime. Sometimes complementary cumulative distribution functions are called survival functions in general. f85da6f288

Periodic function An example is the function f . functions. Functions that map real numbers to real numbers can display periodicity, which is often visualized on a graph f85da6f288

Let the lifetime f85da6f288

Function (mathematics) a function is uniquely represented by the set of all pairs $(x, f(x))$, called the graph of the function, a popular means of illustrating the function f85da6f288

Signal-flow graph term, is a specialized flow graph, a directed graph in which nodes represent system variables, and branches

(edges, arcs, or arrows) represent functional f85da6f288

Directed acyclic graph In mathematics, particularly graph theory, and computer science, a directed acyclic graph (DAG) is a directed graph with no directed cycles. That is, it f85da6f288

The survival function is also known as the survivor function or reliability function. f85da6f288

Graph theory computer science, graph theory is the study of graphs, which are mathematical structures used to model pairwise relations between objects. A graph in this context f85da6f288

== Definition == f85da6f288

Survival function The y-axis is the proportion of subjects surviving. The graphs below show examples of hypothetical survival functions. The x-axis is time. The graphs show The survival function is a function that gives the probability that a patient, device, or other object of interest will survive past a certain time f85da6f288

Graph labeling given a graph $G = (V, E)$, a vertex labeling is a function of V to a set of labels; a graph with such a function defined is called a vertex-labeled graph. Likewise f85da6f288
