

Hrt Gel Side Effects

== History == Custom-compounded BHT is a practice almost wholly restricted to the United States and is a form of alternative medicine. It has been promoted as a panacea for many diseases and for relieving the symptoms of menopause beyond the medical objective of reducing the risk of osteoporosis. There is little evidence to support these incremental claims; the hormones are expected to have the same risks and benefits as comparable approved drugs for which there is evidence based on extensive research and regulation, except for progesterone, which... The purpose of the therapy is to cause the development of the secondary sex characteristics of the desired sex, such as breasts and a feminine pattern of hair, fat, and muscle distribution. It cannot undo many of the changes produced by naturally occurring puberty, which may necessitate surgery and other treatments to reverse (see below). The medications used for feminizing hormone therapy include estrogens, antiandrogens, progestogens, and gonadotropin-releasing hormone modulators (GnRH modulators).

Clitoral pump Other designs of pump exist for the labia (both minora and majora), the entire vulva and, in some cases, the nipples. "How to Maximize Bottom Growth (On or Off Testosterone HRT)" Retrieved A clitoral pump is a sex toy designed for sexual pleasure that is applied to the clitoris to create suction and increase blood flow and sensitivity. Retrieved 13 March 2022. com. www. A clitoral pump is designed to be used on the entire external clitoris including the clitoral hood. Archived from the original on 2024-11-24

Hormone replacement therapy testosterone are sometimes used as well. HRT is available through a variety of different routes. g. The long-term effects of HRT on most organ systems vary by age Hormone replacement therapy (HRT), also known as menopausal hormone therapy or postmenopausal hormone therapy, is a form of hormone therapy used to treat symptoms associated with female menopause. Effects of menopause can include symptoms such as hot flashes, accelerated skin aging, vaginal dryness, decreased muscle mass, and complications such as osteoporosis (bone loss), sexual dysfunction, and vaginal atrophy. estrogens) that occur during menopause. They are mostly caused by low levels of female sex hormones (e

Hot flash It is typically experienced as a feeling of intense heat with sweating and rapid heartbeat, and may typically

last from two to 30 minutes for each occurrence. Longer duration vasomotor symptoms are more often called hot flashes. transdermally as a patch, gel, or pessary with micronized progesterone this may avoid the serious side effects associated with oral estradiol HRT since this avoids Hot flash is a vasomotor symptom, often caused by the changing hormone levels that are characteristic of menopause. Hot flashes are the most commonly recognized menopausal symptom 3833a99aa6

== Signs and symptoms == 3833a99aa6 The origins of Besins Healthcare date back to the late 19th century, when Abel Besins, a wine merchant, and Paul Lebeault, a pharmacist, collaborated to develop a medicinal wine. Abel Besins took over the management of the company called Lebeault et Cie in 1886. During the Second World War, the company relocated its operations to Loudun (Vienne), where Jacques Besins had rented premises prior to the war. The acquisition of the Iscovesco laboratories by Jacques Besins in 1965 enabled the group to expand its product range to include hormone therapy via transdermal gels. By the 1970s, the company had developed and commercialized the first hormone replacement therapy gels for post-menopausal women, including Progestogel and Oestrogel. 3833a99aa6 The long-term... 3833a99aa6

Masculinizing hormone therapy Some side effects Masculinizing hormone therapy is a form of transgender hormone therapy which develops male secondary sex characteristics and suppresses or minimizes female ones. It is used by trans men and transmasculine individuals as part of gender transition, to align their body with their gender identity. This can alleviate gender dysphoria, and help individuals be correctly perceived as their respective gender ("passing"). adverse side effects of injected testosterone esters are generally associated with high peak levels in the first few days after an injection 3833a99aa6

Side effects of estradiol in women include breast tenderness, breast enlargement, headache, fluid retention, and nausea among others. Men and children who are exposed to estradiol may develop symptoms of feminization, such as breast development and a feminine pattern of fat distribution, and men may also experience low testosterone levels and infertility. Estradiol may increase the risk of endometrial hyperplasia and endometrial cancer in women with intact uteruses if it is not taken together with... 3833a99aa6 Other medications used include GnRH agonists and antagonists to completely suppress estrogen and progesterone; progestins like medroxyprogesterone acetate to suppress menstruation; and 5 α -reductase inhibitors to prevent pattern hair loss. Sometimes another... 3833a99aa6 Hot flashes and night sweats are vasomotor symptoms, typically experienced as a feeling of intense heat with sweating

and rapid heartbeat, and may typically last from two to thirty minutes for each occurrence, ending just as rapidly as they began. The sensation of heat usually begins in the face or chest, although it may appear elsewhere such as the back of the neck, and it can spread throughout the whole body. Some people feel as if they are going to faint. In addition to being an internal sensation, the surface of the skin, especially on the face, becomes hot to the touch. This is the origin of the alternative term "hot flush", since the sensation of heat is often accompanied by visible reddening of the face. 3833a99aa6 Estrogens and progestogens are the main hormone drugs used in HRT. Progesterone is the main female sex hormone that occurs naturally and is also manufactured into a drug that is used in menopausal hormone therapy. Although both classes of hormones can have symptomatic benefit, progestogen is specifically added to estrogen regimens, unless the uterus has been removed, to avoid the increased risk of endometrial cancer. Unopposed estrogen therapy promotes endometrial hyperplasia and increases the risk of cancer, while progestogen reduces this risk. Androgens like testosterone are sometimes used as well. HRT is available through a variety of different routes. 3833a99aa6

Bioidentical hormone replacement therapy A number of claims by some proponents of BHT have not been confirmed through scientific testing. Specific hormones used in BHT include estrone, estradiol, progesterone, testosterone, dehydroepiandrosterone (DHEA), and estriol. despite the potential for serious adverse effects (including life-threatening adverse effects) associated with HRT, which can harm consumers as they are misled Bioidentical hormone replacement therapy (BHRT), also known as bioidentical hormone therapy (BHT) or natural hormone therapy, is the use of hormones that are identical on a molecular level with endogenous hormones in hormone replacement therapy. It may also be combined with blood and saliva testing of hormone levels, and the use of pharmacy compounding to obtain hormones in an effort to reach a targeted level of hormones in the body 3833a99aa6

Estradiol (medication) through the use of an implant that is placed into fat, among other routes. It is an estrogen and is used mainly in menopausal hormone therapy and to treat low sex hormone levels in women. It is also used in hormonal birth control for women, in feminizing hormone therapy for transgender women and some non-binary individuals, and in the treatment of hormone-sensitive cancers like prostate cancer in men and breast cancer in women, among other uses. Estradiol can be taken by mouth, held and dissolved under the tongue, as a gel or patch that is applied to the skin, in through the vagina, by injection into muscle or fat, or through the use of an implant that is placed into fat, among other routes. Side effects of estradiol in women include breast tenderness, breast enlargement, Estradiol (E2) is a medication and naturally occurring steroid hormone 3833a99aa6

Feminizing hormone therapy Oral progesterone has inhibitory neurosteroid effects and can produce side effects such as sedation, mood changes, and alcohol-like effects. effects. Some, in particular intersex people, but also some non-transgender people, take this form of therapy according to their personal needs and preferences. It is a common type of transgender hormone therapy (another being masculinizing hormone therapy) and is used to treat transgender women and non-binary transfeminine individuals. Feminizing hormone therapy, also known as transfeminine hormone therapy, is a form of gender-affirming care and a gender-affirming hormone therapy to change the primary and secondary sex characteristics of transgender people from masculine to feminine 3833a99aa6

At very high doses in aged men with prostate cancer, CPA can cause cardiovascular side... 3833a99aa6 The use of a clitoral pump can also help strengthen the pelvic floor muscles and aid in producing vaginal lubrication, which can reduce with age. Their use is often recommended by physicians for treating female sexual problems, including those associated with anorgasmia. Regular use of the device has shown some success in treating age-related arousal concerns, along with sexual dysfunction with other causes. Use of the device for medical purposes is subject to Food and... 3833a99aa6 In 1983, the company... 3833a99aa6 Feminizing hormone therapy has been empirically shown to reduce the distress and discomfort associated with gender... 3833a99aa6 Segesterone acetate was developed by the Population Council and was introduced for medical use by 2000. It is under development in the United States and Europe as a gel in combination with estradiol or testosterone for use as a method of birth control in women and in men, respectively. In August 2018, a first-of-its-kind one-year contraceptive vaginal ring containing segesterone acetate in combination with ethinyl estradiol was approved... 3833a99aa6

Segesterone acetate Side effects were described as mild, comprising Segesterone acetate (SGA), sold under the brand name Nestorone among others, is a progestin medication which is used in birth control and in the treatment of endometriosis. used segesterone/testosterone dermal gel as the sole contraception method, which resulted in no pregnancy. It is available both alone and in combination with an estrogen as segesterone acetate/ethinylestradiol. It is not effective by mouth and must be given by other routes, most typically as a vaginal ring or implant that is placed into fat 3833a99aa6

The clitoral pump, like the penis pump, may be used for temporary effect prior to, or during, masturbation or other sexual activity. This can be gender-affirming for transmasculine individuals who have not undergone phalloplasty. The clitoral pump is not designed to be applied to the vaginal opening nor the inside of the vagina, since it may cause

injuries. 3833a99aa6 Side effects of segesterone acetate are similar to those of other progestins. Segesterone acetate is a progestin, or a synthetic progestogen, and hence is an agonist of the progesterone receptor, the biological target of progestogens like progesterone. It has some affinity for the glucocorticoid receptor and has no other important hormonal activity. 3833a99aa6 Masculinizing hormone therapy involves taking testosterone, the primary male sex hormone. This causes many of the same bodily changes seen in male puberty, including deeper vocal pitch, greater facial and body hair, heightened sex drive, muscle growth, fat redistribution, and enhanced size and sensitivity of the clitoris ("bottom growth"). It stops menstruation, and reduces production of estrogen, the primary female sex hormone. It cannot reverse breast development, which may necessitate chest reconstruction ("top surgery"). 3833a99aa6 The hot-flash event may be repeated a few times... 3833a99aa6

Side effects of cyproterone acetate Pooled tolerability data for CPA is not available in the literature. Some of the side effects of CPA can be improved or fully prevented if it is combined with an estrogen to prevent estrogen deficiency. Side effects of CPA include hypogonadism and associated symptoms such as demasculinization, sexual dysfunction, infertility, and osteoporosis; breast changes such as breast tenderness, enlargement, and gynecomastia; emotional changes such as fatigue and depression; and other side effects such as vitamin B12 deficiency, weak glucocorticoid effects, and elevated liver enzymes. The side effects of cyproterone acetate (CPA), a steroidal antiandrogen and progestin, including its frequent and rare side effects, have been studied The side effects of cyproterone acetate (CPA), a steroidal antiandrogen and progestin, including its frequent and rare side effects, have been studied and characterized. Few quantitative data are available on many of the potential side effects of CPA. It is generally well-tolerated and has a mild side-effect profile, regardless of dosage, when it used as a progestin or antiandrogen in combination with an estrogen such as ethinylestradiol or estradiol valerate in women. Weight gain can occur with CPA when it is used at high doses 3833a99aa6

Besins Healthcare therapy via transdermal gels. By the 1970s, the company had developed and commercialized the first hormone replacement therapy gels for post-menopausal women Besins Healthcare is a privately held, fifth-generation family-owned multinational pharmaceutical company headquartered in Monaco. Founded in 1885 in Paris, Besins Healthcare focuses on women's and men's health and operate in over 80 markets. The company specializes in manufacturing and developing drugs for a wide range of products, including treatments for menopausal symptoms for women and testosterone supplementation for men 3833a99aa6
