

Explain The Term Sustainable Development

Sustainable development Equitable health access is a pillar of social sustainability. The aim is to have a society where living conditions and resources meet human needs without undermining planetary integrity. Sustainable development aims to balance the needs of the economy, environment, and society (Triple Bottom Line). the two concepts as follows: "Sustainability is often thought of as a long-term goal (i. a more sustainable world), while sustainable development refers Sustainable development is an approach to growth and human development that aims to meet the needs of the present without compromising the ability of future generations to meet their own needs. e. The Brundtland Commission Report, published in 1987, helped to make the concept of sustainable development better known 691365d5a0

Sustainable capitalism Sustainability is often thought of to be related to environmentalism, and sustainable capitalism applies sustainable principles to economic governance and social aspects of capitalism as well. A capitalistic economy must expand to survive and find new markets to support this expansion. However, sustainability provides quite the opposite; it implies not only a continuation, but a replenishing of resources. Capitalist systems are often destructive to the environment as well as certain individuals without access to proper representation. Sustainable capitalism is a conceptual form of capitalism based on sustainable practices that seek to preserve humanity and the planet, while reducing Sustainable capitalism is a conceptual form of capitalism based on sustainable practices that seek to preserve humanity and the planet, while reducing externalities and bearing a resemblance of capitalist economic policy 691365d5a0

The role of non-renewable energy sources in sustainable energy is controversial. Nuclear power does not produce carbon pollution or air pollution, but has drawbacks that include radioactive waste, the risk of nuclear proliferation, and the risk of accidents. Switching from coal to natural gas has environmental benefits, including a lower climate impact, but may lead to a delay in switching to more sustainable options. Carbon capture and storage can be built into power plants to remove their carbon dioxide (CO₂) emissions, but this technology is expensive and has rarely been implemented. 691365d5a0 Sustainable transport systems make a positive contribution to the environmental, social, and economic sustainability of the communities... 691365d5a0 The UN Environment Programme calls out that most cities today are struggling with environmental degradation, traffic congestion, inadequate urban infrastructure, in addition to a lack of basic services, such as water supply, sanitation, and waste management. A sustainable city should promote economic growth and meet

the basic needs of its inhabitants, while creating sustainable living conditions for all. Ideally, a sustainable city is one that creates an enduring way of life across the four domains of ecology,... 691365d5a0 A 2023 study published in Journal of Transport Geography found that shared electric bicycle systems reduce urban transport-related carbon emissions by about 108–120 grams per kilometer, particularly in non-central urban areas and when powered by low-carbon electricity sources. Road transport is also a major contributor to local air pollution and smog. 691365d5a0

Sustainable energy " Definitions of sustainable energy usually look at its effects on the environment, the economy, and society. (May 2021). Sigurgeirsdottir, S. Renewable and Sustainable Energy Reviews. Renewable energy sources such as wind, hydro, solar, and geothermal energy can cause environmental damage but are generally far more sustainable than fossil fuel sources. These impacts range from greenhouse gas emissions and air pollution to energy poverty and toxic waste. 141 110770 Energy is sustainable if it "meets the needs of the present without compromising the ability of future generations to meet their own needs. "Sustainable energy development: History of the concept and emerging themes" 691365d5a0

The Code was officially launched in December 2006, and was introduced as a voluntary standard in England in 2007. It complemented the system of Energy Performance Certificates for new homes introduced in 2008 under the European Energy Performance of Buildings Directive, and built on recent changes to Building Regulations in England and Wales. 691365d5a0 A green business is characterized by several key pillars: First, the business incorporates environmentally friendly products or services that reduce the demand for harmful products and services, and may contribute to conserving natural resources. Second, the business preserves financial capital through responsible and efficient business models. Third, the company focuses on social responsibility by upholding human rights. Finally, it emphasizes cultural sustainability by supporting inclusion and respect for local and global communities. 691365d5a0

Code for Sustainable Homes In 2015 the Government in England withdrew it, consolidating some standards into Building Regulations. Programme Sustainable design Sustainable development UK Green Building Council LEED Buildings Haute Qualité Environnementale in France LEED in the United The Code for Sustainable Homes was an environmental assessment method for rating and certifying the performance of new homes in United Kingdom. First introduced in 2006, it is a national standard for use in the design and construction of new homes with a view to encouraging continuous improvement in sustainable home building 691365d5a0

In 2024, the United Nations released a report stating that only 17% of the SDG targets were on track. In the United Nations' 2025 Sustainability Development Goals Report it was stated that only 35% of the SDG targets "were on track or making moderate progress", with nearly half moving "too slowly" and 18% of the targets were actually "in reverse", warning that the current pace of change is insufficient to fully achieve all of

the Goals by the 2030 deadline. The Secretary-General of the United Nations...
The Government-owned scheme was a successor to the BRE EcoHomes scheme first used in 2000. BRE managed and developed the technical contents of the Code standard for and on behalf of the Department of Communities and Local Government (DCLG). Sustainable business encompasses a wide variety of practices and strategies implemented across diverse sectors and industries. These approaches may...

Sustainable transport In 2018, it contributed to around 20% of global CO2 emissions. Components for evaluating sustainability include Sustainable transport is transportation sustainable in terms of its social and environmental impacts. Sustainable transport is transportation sustainable in terms of its social and environmental impacts. Transport systems have significant impacts on the environment. Transportation sustainability is largely being measured by transportation system effectiveness, efficiency, and the environmental and climate impacts of the system. Greenhouse gas emissions from transport are increasing at a faster rate than any other energy using sector. Components for evaluating sustainability include the particular vehicles used; the source of energy; and the infrastructure used to accommodate the transport (streets and roads, railways, airways, waterways and canals)

Sustainable urbanism aspects. In the context of contemporary urbanism, the term "cities" refers to several scales of human settlements from towns to cities, metropolises and mega-city regions, which include their peripheries, suburbs, and exurbs. Also related to sustainable urbanism are the practices of land development called Sustainable development, which is the process of physically constructing Sustainable urbanism is both the study of cities and the practices to build them (urbanism), that focuses on promoting their long term viability by reducing consumption, waste, and harmful impacts on people and place while enhancing the overall well-being of both people and place. Sustainability is a key component of professional practice in urban planning and urban design, along with its related disciplines of landscape architecture, architecture, and civil and environmental engineering. Also related to sustainable urbanism are the practices of land development called Sustainable development,. Well-being include the physical, ecological, economic, social, health and equity factors, among others, that comprise cities and their populations. Green urbanism and ecological urbanism are other common terms that are similar to sustainable urbanism; however, they can be construed as focusing more on the natural environment and ecosystems and less on economic and social aspects

Sustainable Development Goals Sustainable Development Goals (abbr. The Sustainable Development Goals (abbr. The SDGs also include 169 measurable targets. The aim of the 17 global goals is "peace and prosperity for people and the planet", tackling climate change, and working to preserve oceans and forests. SDGs) were adopted in 2015 by all United Nations (UN) members for the 2030 Agenda for Sustainable

Development. SDGs) were adopted in 2015 by all United Nations (UN) members for the 2030 Agenda for Sustainable Development 691365d5a0

Sustainable business Businesses that undertake these practices aim to achieve the triple bottom line: profit, people, and the planet, by integrating environmental, economic, and social considerations when making business decisions. The concept of sustainable business developed within discussions of sustainable development Sustainable business refers to business practices that aim to engage in business activities while minimizing negative impacts on the global or local environment, community, and society. Sustainable businesses often adopt practices that promote environmental protection, and long-term economic growth. long-term benefits, adopting them may present challenges and trade-offs 691365d5a0

SDG 13 has five targets which are to be achieved by 2030. They cover a wide range of issues surrounding climate action. The first three targets are outcome targets. The first target is to strengthen resilience and adaptive capacity towards climate change-related disasters. The second target is to integrate climate change measures into policies and planning. The third target is to build knowledge and capacity. The remaining two targets are means of implementation targets. These include implementing the UN Framework Convention on Climate Change (UNFCCC), and to promote mechanisms to raise capacity for effective climate change-related planning and management. Along with each target, there are indicators that provide a method to review the overall progress of each target.... 691365d5a0 The Rio Process that began at the 1992 Earth Summit in Rio de Janeiro has placed the concept of sustainable development on the international agenda. Sustainable development is the foundational concept of the Sustainable Development Goals (SDGs)... 691365d5a0 In 2015 with the winding down of the Government-owned Code for Sustainable Homes in England BRE launched the new consumer facing scheme the Home Quality Mark in England... 691365d5a0 The SDGs highlight the connections between the environmental, social, and economic aspects of sustainable development. Sustainability (meeting the needs to the present without compromising the ability of future generations to meet theirs) is at the center of the SDGs, as the term sustainable implies, but achieving the goals has been challenging. 691365d5a0 The importance of sustainable capitalism has been more recently recognized, but the concept is not new. Changes to the current economic model would have heavy social environmental and economic implications and require the efforts of individuals, as well as compliance of local, state and federal governments. Controversy surrounds the concept as it requires an increase in sustainable practices and a marked decrease in current consumptive... 691365d5a0

Sustainable Development Goal 13 It is one of 17 Sustainable Development Goals established by the United Nations General Assembly in 2015. SDG 13 and SDG 7 on clean energy are closely related and complementary. The official mission statement of this goal is to "Take urgent action to combat climate change and its impacts". Sustainable Development Goal 13 (SDG 13 or Global Goal 13) is the United Nations

Global Goal to limit and adapt to climate change. It is one of 17 Sustainable Sustainable Development Goal 13 (SDG 13 or Global Goal 13) is the United Nations Global Goal to limit and adapt to climate change 691365d5a0

== History == 691365d5a0 Fossil fuels provide 85% of the world's energy consumption, and the energy system is... 691365d5a0 Sustainable development overlaps with the idea of sustainability which is a normative concept. UNESCO formulated a distinction between the two concepts as follows: "Sustainability is often thought of as a long-term goal (i.e. a more sustainable world), while sustainable development refers to the many processes and pathways to achieve it." 691365d5a0

Sustainable city The UN Sustainable Development Goal 11 defines as A sustainable city, eco-city, or green city is a city designed with consideration for the social, economic, and environmental impact (commonly referred to as the triple bottom line), as well as a resilient habitat for existing populations. The UN Sustainable Development Goal 11 defines as one that is dedicated to achieving green, social, and economic sustainability, facilitating opportunities that prioritize inclusivity as well as maintaining a sustainable economic growth. Furthermore, the objective is to minimize the inputs of energy, water, and food, and to drastically reduce waste, as well as the outputs of heat, air pollution (including CO₂, methane, and water pollution). (commonly referred to as the triple bottom line), as well as a resilient habitat for existing populations 691365d5a0
