

What Causes Bartholin Cyst

Vaginal disease The most common of these is Bartholin's cyst. of the vagina is always abnormal. The cyst, which can feel like a pea, is formed by a blockage in glands

Anaerobic infection genital tract infections caused by anaerobic bacteria are polymicrobial and include: soft-tissue perineal, vulvar and Bartholin gland abscesses; bacterial

Cyst A cyst may contain air, fluids, or semi-solid material. Once formed, a cyst may resolve on its own. A collection of pus is called an abscess, not a cyst. ovary) Vaginal cysts Gartner's duct cyst (lateral to vaginal wall) Bartholin's cyst (at vaginal introitus) Skene's duct cyst (beside the urinary meatus) Ectopic A cyst is a closed sac in the body, having a distinct envelope and division compared with the nearby tissue. Otherwise, it may need to be removed surgically, depending upon its type and location. Hence, it is a cluster of cells that have grouped together to form a sac (like the manner in which water molecules group together to form a bubble); however, the distinguishing aspect of a cyst is that the cells forming the "shell" of such a sac are distinctly abnormal (in both appearance and behaviour) when compared with all surrounding cells for that given location

Lymphatic system described in the 17th century independently by Olaus Rudbeck and Thomas Bartholin. The lymphatic system consists of a conducting network of lymphatic vessels

== Pathophysiology ==

Skene's gland It is. syndrome, or female prostatitis) Skene's duct cyst: lined by stratified squamous epithelium, the cyst is caused by obstruction of the Skene's glands

More broadly, endometriosis is the presence of tissue similar to, but distinct from, endometrial tissue located outside the uterus. The presence of endometriosis can result in the formation of scar tissue, adhesions and an inflammatory reaction.

Vaginal discharge transudate from the vaginal walls and secretions from glands (Skene's and Bartholin's). The solid components or elements are exfoliated epithelial cells from

Abscess with carbuncles being larger. A cyst is related to an abscess, but it contains a material other than pus, and a cyst has a clearly defined wall. Abscesses

Cancer-related cysts are formed as a defense mechanism for the body following the development of mutations that lead to an uncontrolled cellular division. Once such a mutation has occurred, the affected cells divide incessantly and become cancerous, forming a tumor. The body encapsulates those cells to try to prevent them from continuing their division and contain the tumor, which becomes known as a cyst. That said, the cancerous cells still may mutate further and gain the ability... a9ac277c41

Endometrioma It is the most common form of endometriosis. Endometrioma (also called chocolate cyst) is the presence of tissue similar to, but distinct from, the endometrium—the lining of the uterus (womb)—in and Endometrioma (also called chocolate cyst) is the presence of tissue similar to, but distinct from, the endometrium—the lining of the uterus (womb)—in and sometimes on the ovary. Endometrioma is found in 17–44% patients with endometriosis a9ac277c41

Female genital disease A Bartholin's cyst is an abscess of a Bartholin's gland. ovarian cancer) and vulva are not uncommon. Bartholin's glands are located within the labia, or the a9ac277c41

Human reproductive system The vagina is attached to the uterus through the cervix, while. during intercourse this area is lubricated by mucus secreted by the Bartholin's glands a9ac277c41

Endometriomas are usually benign growths, most often found in the ovary. They form dark, fluid-filled cysts, which can vary greatly in size. The fluid inside the cysts is thick, dark, old blood that resembles the color of chocolate, giving it the name chocolate cyst. It can also develop in the cul-de-sac (the space behind the uterus), the surface of the uterus, and between the vagina and rectum. a9ac277c41
