

Blood Pressure Fluctuation Reason

Cerebral perfusion pressure Cerebral perfusion pressure (CPP) is the net pressure gradient causing cerebral blood flow to the brain (brain perfusion). It must be maintained within

Pressure measurement Differential pressure is the difference in pressure between. atmospheric pressure fluctuation (weather) is reflected as an error in the measurement result

An important quantitative relationship (Goldmann's equation) is as follows:

Sinus pericranii Sinus pericranii typically presents as soft palpable masses along the midline skull, which may fluctuate in size. aesthetic reasons and prevention of bleeding

Hemorheology haima 'blood'; and rheology, from Greek ῥέω rhéō, 'flow' and -λογία, -logia 'study of'), or blood rheology, is the study of flow properties of blood and

Hypovolemic shock ultrasound, central venous pressure monitoring, and pulse pressure fluctuation as described above. Vasopressors may be used if blood pressure does not improve with

Diving air compressor A low pressure diving air compressor usually has a delivery pressure of up to. with high-pressure air pure enough to be used as a hyperbaric breathing gas

Intraocular pressure Intraocular pressure (IOP) is the fluid pressure inside the eye. pressure laws follow fundamentally from physics. IOP is an important aspect in the evaluation of patients at risk of glaucoma. Tonometry is the method eye care professionals use to determine this. Most tonometers are calibrated to measure pressure in millimeters of mercury (mmHg). Any kinds of intraocular surgery should be done by considering the intraocular pressure fluctuation

Blood Pressure Fluctuation Reason

Azotemia Xerostomia (dry mouth) Thirst Edema, anasarca (swelling) Orthostatic blood pressure (fluctuates depending on body position) Uremic frost, a condition that occurs

Intraocular pressure is determined by the production and drainage of aqueous humour by the ciliary body and its drainage via the trabecular meshwork and uveoscleral outflow. The reason for this is that the vitreous humour in the posterior segment has a relatively fixed volume and thus does not affect intraocular pressure regulation.

Orthostatic hypotension commonly known as headrush, is a medical condition wherein a person's blood pressure drops (hypotension) when they are standing up (orthostasis) or sitting

== Physiology ==

Subdural hematoma pressure they place on the brain: As intracranial pressure rises, blood is squeezed into the dural venous sinuses, raising the dural venous pressure and
