

Permanent Magnet Moving Coil

== History == eed29dfc84 The main advantage of an electromagnet over a permanent magnet is that the magnetic field can be quickly changed by controlling the amount of electric current in the winding. However, unlike a permanent magnet, which needs no power, an electromagnet requires a continuous supply of current to maintain the magnetic field. eed29dfc84

Pole piece Pole pieces are used with both permanent magnets and. A pole piece attaches to and in a sense extends a pole of the magnet, hence the name. by a magnet eed29dfc84

Instruments used to measure smaller currents, in the milliampere or microampere range, are designated as milliammeters or microammeters. Early ammeters were laboratory instruments that relied on the Earth's magnetic field for operation. By the late 19th century, improved instruments were designed which could be mounted in any position and allowed accurate measurements in electric power systems. It is generally represented by letter 'A' in a circuit. eed29dfc84 The first commercially successful type of electrical phonograph pickup was introduced in 1925. Although electromagnetic, its resemblance to later magnetic cartridges is remote: it employed a bulky horseshoe... eed29dfc84

Moving magnet actuator It typically consists of an arrangement of a mobile permanent magnet and fixed A moving magnet actuator is a type of electromagnetic linear actuator. It typically consists of an arrangement of a mobile permanent magnet and fixed coil, arranged so that currents in the coil generate a pair of equal and opposite forces between the coil and magnet. A moving magnet actuator is a type of electromagnetic linear actuator eed29dfc84

A permanent magnet is an object made from a material that is magnetized and creates its own persistent magnetic field. An everyday example is a refrigerator magnet used to hold notes on a refrigerator door. Materials that can be magnetized, which are also the ones that are strongly attracted to a magnet, are called ferromagnetic (or ferrimagnetic). These include the elements iron, nickel and cobalt and their alloys, some alloys of rare-earth metals, and some naturally occurring minerals such as lodestone. Although ferromagnetic (and ferrimagnetic)

materials are the only ones attracted to a magnet strongly enough to be commonly considered magnetic, all other substances respond weakly to a magnetic field, by one of several other types of magnetism. eed29dfc84
Tubular linear motor eed29dfc84

Voice coil from a permanent magnet fixed to the speaker's frame, thereby moving the cone of the speaker. It provides the motive force to the cone by the reaction of a magnetic field to the current passing through it. By applying an audio waveform to the voice coil, the cone A voice coil (consisting of a former, collar, and winding) is the coil of wire attached to the apex of a loudspeaker cone eed29dfc84

Galvanometers have been essential for the development of science and technology in many fields. For example, in the 1800s they enabled long-range communication through submarine cables, such as the earliest transatlantic telegraph... eed29dfc84 The term is also used for voice coil linear motors such as those used to move the heads inside hard disk drives, which produce a larger force and move a longer distance but work on the same principle. In some applications, such as the operation of servo valves, electronic focus adjustment on digital cameras, these are known as voice coil motors (VCM). eed29dfc84

Galvanometer a stationary permanent magnet and a moving coil of wire, suspended by fine wires which provided both an electrical connection to the coil and the restoring A galvanometer is an electromechanical measuring instrument for electric current. The mechanism is also used as an actuator in applications such as hard disks. Galvanometers work by deflecting a pointer in response to an electric current flowing through a coil in a constant magnetic field. Early galvanometers were uncalibrated, but improved versions, called ammeters, were calibrated and could measure the flow of current more precisely eed29dfc84

Electromagnet The wire turns are often wound around a magnetic core made from a ferromagnetic or ferrimagnetic material such as iron; the magnetic core concentrates the magnetic flux and makes a more powerful magnet. Electromagnets usually consist of copper wire wound into a coil. A current through the wire creates a magnetic field which is concentrated along the center of the coil. type of magnet in which the magnetic field is produced by an electric current. Electromagnets usually consist of copper wire wound into a coil. The magnetic field disappears when the current is turned off. A current An electromagnet is a type of magnet in which the magnetic field is produced by an electric current eed29dfc84

Electromagnets are widely used as components of other electrical devices, such as motors, generators,

electromechanical solenoids, relays, loudspeakers, hard disks, MRI machines, scientific instruments, and magnetic separation equipment. Electromagnets are also employed in industry for picking up and moving heavy iron objects such as scrap iron... eed29dfc84 A voice coil actuator, also called a voice coil motor (VCM), is an electromagnetic linear actuator where the magnet is fixed and the coil is mobile. In this configuration the coil is common called a voice coil. eed29dfc84 The cartridge contains a removable or permanently mounted stylus, the tip - usually a gemstone, such as diamond or sapphire - which makes physical contact with the record's groove. In popular usage and in disc jockey jargon, the stylus, and sometimes the entire cartridge, is often called the needle. As the stylus tracks the serrated groove, it vibrates a cantilever on which is mounted a permanent magnet which moves between the magnetic fields of sets of electromagnetic coils in the cartridge (or vice versa: the coils are mounted on the cantilever, and the magnets are in the cartridge). The shifting magnetic fields generate an electrical current in the coils. The electrical signal generated by the cartridge can be amplified and then converted into sound by a loudspeaker. eed29dfc84

Ammeter Moving magnet ammeters operate on essentially the same principle as moving coil, except that the coil is mounted in the meter case, and a permanent magnet An ammeter (abbreviation of ampere meter) is an instrument used to measure the current in a circuit. An ammeter usually has low resistance so that it does not cause a significant voltage drop in the circuit being measured. For direct measurement, the ammeter is connected in series with the circuit in which the current is to be measured. Electric currents are measured in amperes (A), hence the name eed29dfc84

Loudspeaker coil—a coil of wire capable of moving axially in a cylindrical gap containing a concentrated magnetic field produced by a permanent magnet—the coil is eed29dfc84

Magnet and attracts or repels other magnets. Often, the coil is wrapped A magnet is a material or object that produces a magnetic field. from a coil of wire that acts as a magnet when an electric current passes through it but stops being a magnet when the current stops. This magnetic field is invisible but is responsible for the most notable property of a magnet: a force that pulls on other ferromagnetic materials, such as iron, steel, nickel, cobalt, etc eed29dfc84

Magnetic cartridge mounted a permanent magnet which moves between the magnetic fields of sets of electromagnetic coils in the cartridge (or vice versa: the coils are mounted A magnetic cartridge, more commonly called a phonograph cartridge or phono cartridge or (colloquially) a pickup, is an electromechanical transducer

that is used to play phonograph records on a turntable eed29dfc84

== Operation == eed29dfc84 == History == eed29dfc84 == See also == eed29dfc84 By driving a current through the voice coil, a magnetic field is produced. This magnetic field causes the voice coil to react to the magnetic field from a permanent magnet fixed to the speaker's frame, thereby moving the cone of the speaker. By applying an audio waveform to the voice coil, the cone will reproduce the sound pressure waves, corresponding to the original input signal. eed29dfc84 Before the electropermanent magnet was invented, applications needing a controllable magnetic field required electromagnets, which consume large amounts of power when operating. Electropermanent magnets require no power source to maintain the magnetic field. Electropermanent magnets made with powerful rare-earth magnets are used as industrial lifting (tractive) magnets to lift heavy ferrous metal objects; when the object reaches its destination the magnet can be switched off, releasing the object... eed29dfc84

Electropermanent magnet When the magnetically soft and hard materials have opposing magnetizations, the magnet produces no net external field across its poles, while when their direction of magnetization is aligned the magnet produces an external magnetic field. The magnet consists of two sections, one of "hard" (high coercivity) magnetic material and one of "soft" (low coercivity) material. An electropermanent magnet (EPM) is a type of permanent magnet in which the external magnetic field can be switched on or off by a pulse of electric current. An electropermanent magnet (EPM) is a type of permanent magnet in which the external magnetic field can be switched on or off by a pulse of electric current in a wire winding around part of the magnet. The direction of magnetization in the latter piece can be switched by a pulse of current in a wire winding about the former eed29dfc84

Galvanometers came from the observation, first noted by Hans Christian Ørsted in 1820, that a magnetic compass's needle deflects when near a wire having electric current. They were the first instruments used to detect and measure small amounts of current. André-Marie Ampère, who gave mathematical expression to Ørsted's discovery, named the instrument after the Italian electricity researcher Luigi Galvani, who in 1791 discovered the principle of the frog galvanoscope – that electric current would make the legs of a dead frog jerk. eed29dfc84 Ferromagnetic materials can be divided into magnetically "soft" materials like annealed iron, which can be magnetized but do not tend to stay magnetized... eed29dfc84
