The original two games, Golden Sun and Golden Sun: The Lost Age, were released in 2001 and 2002, respectively, for the Game Boy Advance. A third game, Golden Sun: Dark Dawn, was released for the Nintendo DS in 2010. In Golden Sun, the player controls protagonist Isaac and his companions as they journey through the world of Weyard to prevent a group of anti-heroes from releasing a mysterious power called "Alchemy" to the world. Golden Sun: The Lost Age follows the surviving members from the previous game's antagonists as they continue to pursue the release of Alchemy by lighting four elemental lighthouses. Its mean distance from Earth is about 1.496×10^8 kilometres or about 8 light-minutes. The distance between the Sun and the Earth was used to define a unit of length called the astronomical unit (au), now defined to be 149.5978707×10^6 kilometres. It is the largest and most massive object in the Solar System; its diameter is about 1,391,400 km (864,600 mi), around 109 times that of Earth. The Sun's mass is around 330,000 times that of Earth, making up about 99.86% of the total mass of the Solar System. The mass of the Sun's surface layer, its photosphere, consists mostly of hydrogen (~73%) and helium (~25%), with much smaller quantities of heavier elements... 51ef178409

The Java HotSpot Performance Engine was released on April 27, 1999, built on technologies from an implementation of the programming language Smalltalk named Strongtalk, originally developed by Longview Technologies, which traded as Animorphic. The Longview virtual machine was based on the Self virtual machine, with an interpreter replacing the fast-and-dumb first compiler. When Sun cancelled the Self project, two key people, Urs Hölzle and Lars Bak left Sun to start Longview. In 1997, Sun Microsystems purchased Animorphic. 51ef178409 The Sun Sentinel emphasizes local news, through its Community News and Local sections. The game was praised for successfully transitioning the 2D-style graphics of its predecessors into 3D and for being relatively easy for newcomers to the franchise to play. However, critics noted that the game shared shortcomings present in previous games, such as excessive in-game dialogue, and that the features of the Golden Sun series that were refreshing when the original games were released... 51ef178409 A Sun-synchronous orbit is useful for imaging, reconnaissance, and weather satellites, because every time that the satellite is overhead, the surface illumination angle on the planet underneath it is nearly the same. This consistent lighting is a useful characteristic for satellites that image the Earth's surface in visible or infrared wavelengths, such as weather and spy satellites, and for other remote-sensing satellites, such as those carrying ocean and atmospheric remote-sensing instruments that require sunlight. For example, a satellite in Sun-synchronous orbit might ascend across the equator twelve times a day, each time at approximately 15:00 mean local time. 51ef178409

Sunspots are temporary spots on the Sun's surface that are darker than the surrounding area. Their number varies according to the approximately 11-year solar cycle. Sunspots appear within active regions, usually in pairs of opposite magnetic polarity

Individual sunspots or groups of sunspots may last anywhere from a few days to a few months, but eventually decay. Sunspots expand and contract as they move across the surface of the Sun, with diameters ranging from 16 km (10 mi) to 160,000 km (100,000 mi). Larger sunspots can be visible from Earth without the aid of a telescope. They may travel at relative speeds, or proper motions, of a few hundred meters per second when they first emerge.
