Nonzero: The Logic of Human Destiny, 1999 book by Robert Wright 07f4c09989 We give the construction first in these two cases, under the assumption that we have only two objects. Then we generalize to an arbitrary family of arbitrary modules. The key elements of the general construction are more clearly identified by considering these two cases in depth. 07f4c09989 A general belief system about the antagonistic nature of social relations, shared by people in a society or culture and based on the implicit assumption that a finite amount of goods exists in the world, in which one person's winning makes others the losers, and vice versa ... a relatively permanent and general conviction that social relations are like a zero-

sum game. People who share this conviction believe that success, especially economic success, is possible only at the expense of other people's failures. The classic result in this area is the 1961 theorem of Paul Erdős, Abraham Ginzburg, and Abraham Ziv. They proved that for the group

Zero-sum problem In number theory, zero-sum problems are certain kinds of combinatorial problems about the structure of a finite abelian group. Concretely, given a finite abelian group G and a positive integer n , one asks for the smallest value of k such that every sequence of elements of G of size k contains n terms that sum to 0. If the total gains of the participants are added up, and the total losses are subtracted, they will sum to zero. Thus, cutting a cake, where taking a more significant piece reduces the amount of cake available for others as much as it increases the amount available for that taker, is a zero-sum game if all participants value each unit of cake equally. Other examples of zero-sum games in daily life include games like poker, chess, sport and bridge where one person gains and another person loses, which results in a zero-net benefit for every player. In the markets and financial instruments, futures contracts and options are zero-sum games as well. 07f4c09989 In mathematics, a non-zero element is any element of an algebraic structure other than the zero element. 07f4c09989 A function of a complex variable z is holomorphic in an open domain U if

In other words, player one's gain is equivalent to player two's loss, with the result that the net improvement in benefit of the game is zero 07f4c09989

The most familiar examples of this construction occur when considering vector spaces (modules over a field) and abelian groups (modules over the ring $\mathbb{Z}$ of integers). The construction may

also be extended to cover Banach spaces and Hilbert spaces.

Zero-sum thinking Zero-sum thinking is captured by the saying "your gain is my loss" or, conversely, "your loss is my gain". (2015) defined zero-sum thinking as:. However, unlike the game theory concept, zero-sum thinking refers to a psychological construct—a person's subjective interpretation of a situation. However Zero-sum thinking perceives situations as zero-sum games, where one person's gain would be another's loss. The term is derived from game theory. If f is meromorphic in U , then a zero of f is a pole of $1/f$, and a pole of f is a zero of $1/f$. This induces a duality between zeros and poles, that is fundamental for the study of meromorphic functions. For example, if a function is meromorphic on the whole complex plane plus the point at infinity, then the sum of the multiplicities of its poles equals the sum of the multiplicities of its zeros.

The natural way to extend non-empty sums is to let the empty sum be the additive identity.
