Dengue is spread by several species of female mosquitoes of the Aedes genus, principally Aedes aegypti. The virus has four confirmed serotypes; infection with one type usually gives lifelong immunity to that type, but only short-term immunity to the others. Paracetamol relieves pain in acute mild migraine and episodic tension headaches. At a standard dose, paracetamol slightly reduces fever, though it is inferior to ibuprofen in that respect: the benefits of its use for fever are unclear, particularly in the context of fever of viral origins. Paracetamol is effective for pain after wisdom tooth extraction, but it is less effective than ibuprofen. The combination of paracetamol and ibuprofen provides greater analgesic efficacy than either drug alone. The pain relief paracetamol provides in osteoarthritis is small and clinically insignificant. Evidence supporting its use in low back pain, cancer pain, and neuropathic pain is insufficient.
