

Chain Rule On Partial Derivatives

Automatic differentiation). By applying the chain rule repeatedly to these operations, partial derivatives of arbitrary order can be computed automatically. (exp, log, sin, cos, etc 208bdb6482

... 208bdb6482

Differentiation rules This article is a summary of differentiation rules, that is, rules for computing the derivative of a function in calculus. Unless otherwise stated, all This article is a summary of differentiation rules, that is, rules for computing the derivative of a function in calculus 208bdb6482

z 208bdb6482 • 208bdb6482

Generalizations of the derivative For example, the second order partial derivatives of a. the derivative, one repeatedly applies partial derivatives with respect to different variables 208bdb6482

Leibniz integral rule symmetry of second derivatives, but involving integrals as well as derivatives. This case is also known as the Leibniz integral rule. The following three 208bdb6482

x 208bdb6482

Chain rule More precisely, if. the chain rule is a formula that expresses the derivative of the composition of two differentiable functions z and y in terms of the derivatives of z In calculus, the chain rule is a formula that expresses the derivative of the composition of two differentiable functions z and y in terms of the derivatives of z and y 208bdb6482

Triple product rule reciprocity theorem, is a formula which relates partial derivatives of three interdependent variables. The rule finds application in thermodynamics, where The triple product rule, known variously as the cyclic chain rule, cyclic relation, cyclical rule, Euler's chain rule, or the reciprocity theorem, is a formula which relates partial derivatives of three interdependent variables. The rule

finds application in thermodynamics, where frequently three variables can be related by a function of the form $f(x, y, z) = 0$, so each variable is given as an implicit function of the other two variables. The triple product rule for such interrelated variables x , y , and z comes from using a reciprocity relation on the result of the implicit function theorem, and is given by. For example, an equation of state for a fluid relates temperature, pressure, and volume in this manner

Let D_x be the derivative as a linear map

Derivative (multivariable calculus) In one-variable calculus, this is the tangent line approximation. The chain rule expresses this derivative in terms of the partial derivatives of L and the time derivatives of the functions. In mathematics, the derivative of a function at a point is the linear part of the best affine approximation to the function near the point. $x_n(t)$. In multivariable calculus, the same property is generalized to define the derivative of a vector-valued function or function of a vector argument. Sometimes called the total derivative, in contrast with partial derivatives, the derivative approximates the function with respect to all of its arguments, not just a single one. In many situations, this is the same as considering all partial derivatives simultaneously

$f(x, y)$ is a function of x and y . Then

Product rule In calculus, the product rule (or Leibniz rule or Leibniz product rule) is a formula used to find the derivatives of products of two or more functions

The partial derivative of a function

Derivative If the total derivative exists at $\mathbf{a}$, then all the partial derivatives and directional derivatives of f exist at $\mathbf{a}$.

Partial derivative total derivative, in which all variables are allowed to vary). Partial derivatives are used in vector calculus and differential geometry. Partial derivatives are used in vector calculus and differential geometry. The partial derivative In mathematics, a partial derivative of a function of several variables is its derivative with respect to one of those variables, with the others held constant (as opposed to the total derivative, in which all variables are allowed to vary)

Elementary rules of differentiation In functional analysis, particularly in infinite dimensions, the derivative in this

sense is called the Fréchet derivative. Unless otherwise stated, all functions are functions of real numbers ($\mathbb{R}$)
 $\mathbb{R} \rightarrow \mathbb{R}$, $\mathbb{R}^n \rightarrow \mathbb{R}$
