Artiodactyla Molecular biology, along with fossil discoveries, has found that cetaceans (whales, dolphins, and porpoises) fall within this taxonomic branch, being most closely related to hippopotamuses. The testicles are located in the scrotum and thus outside the abdominal cavity. Another difference between the two orders is that many artiodactyls (except for Suina) digest plant cellulose in one or more stomach chambers rather than in their intestine (as perissodactyls do). Some researchers use "even-toed ungulates" to exclude cetaceans and only include terrestrial artiodactyls, making the term paraphyletic in nature. By contrast, most perissodactyls bear weight on an odd number of the five toes. The ovaries of many females descend as the testicles descend of many Artiodactyla (AR-tee-oh-DAK-tih-lə; from Ancient Greek ἄρτιος ártios 'even' and δάκτυλος dáktulos 'finger, toe') is an order of placental mammals. Some modern taxonomists thus apply the name Cetartiodactyla () to this group, while others opt to include cetaceans within the existing name of Artiodactyla. The other three toes are either present, absent, vestigial, or pointing posteriorly. Typically, they are ungulates which bear weight equally on two (an even number) of their five toes (the third and fourth, often in the form of a hoof) 797be77233
