Less common causes include stroke, brain tumors, brain injury, multiple sclerosis, migraines, trauma, and uneven pressures between the middle ears. Physiologic vertigo may occur following being exposed to motion for a prolonged period such as when on a ship or simply following spinning with the eyes closed. Other causes may include toxin exposures such as to carbon monoxide, alcohol, or aspirin. Vertigo typically indicates a problem in a part of the vestibular system.

Middle ear equalization Diving and Hyperbaric Medicine. doi:10. 51 (4): 328-337. 28920/dhm51 Middle ear equalization, also known as ear clearing, is the process of balancing the pressure of gas in the middle ear with ambient pressure. Pressure regulation is principally achieved by passage of gas through the Eustachian tube, which connects the middle ear to the nasopharynx. The tube normally opens intermittently, including during swallowing and yawning, but deliberate equalization may be required when ambient pressure changes more rapidly than normal Eustachian tube function can compensate. barotrauma and inner ear decompression sickness: a systematic review on differential diagnostics" 3629e8cc7a
