Cryotherapy is often used in an effort to prevent or relieve muscle pain, sprains, and swelling after soft tissue damage or surgery. When a musculoskeletal injury occurs, the body sends signals to the inflammatory cells, macrophages, which release IGF-1. IGF-1 is a hormone-insulin-like growth factor which initiates the termination of damaged tissue. In some cases, this inflammatory response can be aggravated and cause increased swelling and edema, which can prolong the recovery process. It is hypothesized that the practice originated from James Arnott (1797-1883), a senior physician of Brighton Infirmary, that applied a mixture of salt and crushed ice to tumors in the hopes that it would reduce pain and inflammation at the tumor site. It became more widespread after more research was done in the 1970s by Japanese rheumatologist Toshima Yamaguchi. It became more popular in Europe, USA and Australia in the 1980s and 1990s. e3d9c041d0
