List of benzodiazepines "Time to peak" refers to when maximum levels of the drug in the blood occur after a given dose. Some benzodiazepines produce active metabolites. Benzodiazepines generally share the same pharmacological properties, such as anxiolytic, sedative, hypnotic, skeletal muscle relaxant, amnesic, and anticonvulsant effects. Technically this is a thienodiazepine, but The tables below contain a sample list of benzodiazepines and benzodiazepine analogs that are commonly prescribed, with their basic pharmacological characteristics, such as half-life and equivalent doses to other benzodiazepines, also listed, along with their trade names and primary uses. alternative table published by the state of South Australia uses equivalent approximate oral dosages to 5 mg diazepam. The elimination half-life is how long it takes for half of the drug to be eliminated by the body. Active metabolites are produced when a person's body metabolizes the drug into compounds that share a similar pharmacological profile to the parent compound and thus are relevant when calculating how long the pharmacological effects of a drug will last. Variation in potency of certain effects may exist amongst individual benzodiazepines. Long-acting benzodiazepines with long-acting active metabolites, such as diazepam and chlordiazepoxide, are often prescribed for benzodiazepine or alcohol withdrawal
