Drugs in pregnancy Second generation antihistamines include loratadine (Claritin), cetirizine (Zyrtec), and fexofenadine (Allegra). Of those who bear children, recreational drug use can have serious consequences to the health of not only the mother, but also the fetus as many medications can cross the placenta and reach the fetus. In addition a reported 5-10% of women of childbearing age use alcohol or other addictive substances. Some of the consequences on the babies include physical and mental abnormalities, higher risk of stillbirth, neonatal abstinence syndrome (NAS), sudden infant death syndrome (SIDS), low birthweight, and others. The Food and Drug Administration (FDA) in the United States reports that there are six million pregnancies with at least 50% of the women taking at least one medication. First generation antihistamines have the ability Drugs, including medications and recreational drugs, may have effects during pregnancy on the pregnant woman and fetus that vary from the effects of the drug on people who are not pregnant 7fb7a27a4f

Cetirizine Cetirizine is sold under various brand names including Allacan Cetirizine is a second-generation peripherally selective antihistamine used to treat allergic rhinitis (hay fever), dermatitis, urticaria (hives), and runny nose. The degree of benefit is similar to other antihistamines such as diphenhydramine, which is a first-generation antihistamine. It is taken by mouth. Effects generally begin within thirty minutes and last for about a day. using the same brand name as the cetirizine with a "-D" suffix (for example, Zyrtec-D) 7fb7a27a4f

It is sold by Kenvue and is used to relieve allergy symptoms such as sneezing, itching, runny nose, rash, and hives. Some forms of Benadryl are to be taken orally, while some creams and gels are to be applied to the skin. Common side effects of the drug include drowsiness, dizziness, dry mouth and throat, confusion, and blurred vision. 7fb7a27a4f == History == 7fb7a27a4f Common side effects include sleepiness, dry mouth, headache, and abdominal pain. The degree of sleepiness that occurs is generally less than with first-generation antihistamines because second-generation antihistamines are more selective for the H1 receptor. Compared to other second-generation antihistamines, cetirizine can cause drowsiness. Among second-generation antihistamines, cetirizine is more likely than fexofenadine and loratadine to cause drowsiness, but cetirizine shows superior efficacy in the histamine induced wheal and flare paradigm and tends to produce slightly greater clinical symptom relief than fexofenadine, which in turn tends to produce greater symptom relief than loratadine, meanwhile loratadine was unable to show significant superiority over placebo. 7fb7a27a4f
