Minus Eighty Degree Laboratory Freezer for ISS The total capacity of the unit is 300 litres. As well as storage, the freezer is designed to transport samples to and from the ISS in a temperature-controlled environment. The total The Minus Eighty-Degree Laboratory Freezer for ISS (MELFI) is a European-built experiment storage freezer for the International Space Station. It comprises four independent dewars, which can be set to operate at different temperatures. As well as storage, the freezer is designed to transport samples to and from the ISS in a temperature-controlled environment. Both reagents and samples are stored in the freezer. Currently temperatures of -80°C , -26°C , and $+4^{\circ}\text{C}$ are used during in-orbit ISS operations. in the freezer e5a2ef6d03

ULT freezers come in upright and chest freezer formats An ultra low temperature (ULT) freezer is a refrigerator that stores contents at -80 to -86°C (-112 to -123°F). An ultra low temperature freezer is commonly referred to as a "minus 80 freezer" or a "negative 80 freezer", referring to the most common temperature standard e5a2ef6d03

Freezer burn appears as grayish-brown leathery spots on frozen food and occurs when air reaches the food's surface and dries the product. Color changes result from chemical changes in the food's pigment. Freezer burn does not make the food unsafe; it merely causes dry spots in foods. The food remains usable and edible, but removing the freezer burns can improve the flavor.

Freezer (film), a 2014 American thriller film The MELFI flight units were originally designed to be flown fully powered in the Multi-Purpose Logistics Module, permitting pre-made experiments to be flown to the station without contaminating or destroying any samples. == Application ==

Freezer burn that the temperature does not remain consistently below -18°C , can also speed up freezer burn. It is generally caused by food not being securely wrapped in air-tight packaging. Food portal Freeze drying Ice crystals Library of Congress Freezer burn is a condition that occurs when frozen food has been damaged by dehydration and oxidation due to air reaching the food

== History == The dehydration of freezer-burned food is caused by water sublimating from the food into the surrounding atmosphere. The lost water may then be deposited elsewhere in the food and packaging as snow-like crystals. Fluctuation of temperatures in a freezer, such that the temperature does not remain consistently below -18°C , can also speed up freezer burn. == See also ==

Refrigerator Refrigeration is an essential food storage technique around the world. The United States Food and Drug Administration recommends that the refrigerator be kept at or below 4°C (40°F) and that the freezer be regulated at -18°C (0°F). A freezer is a specialized refrigerator, or portion of a refrigerator, that maintains its contents' temperature below the freezing point of water. The optimal temperature range for perishable food storage is 3 to 5°C (37 to 41°F). The low temperature reduces the reproduction rate of bacteria, so the refrigerator lowers the rate of spoilage. The optimal temperature range for perishable food storage is 3 to 5°C (37 to 41°F). A freezer is a specialized refrigerator A refrigerator, commonly shortened to fridge, is a commercial and home appliance consisting of a thermally insulated compartment and a heat pump (mechanical, electronic, or chemical) that transfers heat from its inside to its external environment so that its inside is cooled to a temperature below the ambient temperature of the room. above the freezing point of water. The refrigerator replaced the icebox, which had been a common household appliance for almost a century and a half. A refrigerator maintains a temperature a few degrees above the freezing point of water
