Before the late 2000s, much of the methamphetamine consumed in the US was manufactured domestically by amateur chemists in meth labs. They manufactured it from common household drugs and chemicals such as lye, lithium, and ammonia. 5523a4a64a The United States Drug Enforcement Administration warned in 2019 that the rapid rise of fentanyl supply in the country has led to combinations of both fentanyl and heroin with cocaine ("super speedballs"). In addition, the cross-contamination of powdered fentanyl into cocaine supplies has led to reports of cocaine users unknowingly consuming a speedball-like combination. 5523a4a64a

Death can occur from overdosing on a single or multiple drugs, or from combined drug intoxication (CDI) due to poly drug use. Drug overdoses and intoxication can also cause indirect deaths. Death can occur from overdosing on a Drug overdose and intoxication are significant causes of accidental death and can also be used as a form of suicide. Drug overdose and intoxication are significant causes of accidental death and can also be used as a form of suicide. For example, the chance of death from overdosing on opiates is greatly increased when they are consumed in conjunction with alcohol. Poly drug use often carries more

This suggested that dextroamphetamine and methamphetamine at high (lethal) doses have different mechanisms of toxicity in rats. During World War II, amphetamine and methamphetamine were used extensively by Allied and Axis forces for their stimulant and performance-enhancing effects. As the addictive properties of the drugs became known, governments began to place strict controls on these drugs.
