

Cutaneous Lupus Erythematosus Scl

It has been suggested that it is equivalent to Jessner lymphocytic infiltrate of the skin. 54159e7d42

Tumid lupus erythematosus disorder, a different subtype of cutaneous lupus erythematosus (CLE) from discoid lupus erythematosus (DLE) or subacute CLE (SCLE). LET is usually found on sun-exposed Tumid lupus erythematosus is a rare, but distinctive entity in which patients present with edematous erythematous plaque 54159e7d42

Therapy generally involves sun avoidance and protection and topical corticosteroids. Sometimes systemic drug treatment is necessary. Besides corticosteroids other immunosuppressants such as methotrexate are also used. 54159e7d42 Characteristically the lesions appear in sun-exposed areas such as the vee of the neckline or the forearms, but not the face. It may be brought on by sun-sensitizing medications, but is usually associated with autoimmune disorders such as rheumatoid arthritis and Sjögren's syndrome. 54159e7d42

Subacute cutaneous lupus erythematosus Subacute cutaneous lupus erythematosus (SCLE) is a clinically distinct subset of cases of lupus erythematosus that is most often present in white women Subacute cutaneous lupus erythematosus (SCLE) is a clinically distinct subset of cases of lupus erythematosus that is most often present in white women aged 15 to 40, consisting of skin lesions that are scaly and evolve as poly-cyclic annular lesions or plaques similar to those of plaque psoriasis 54159e7d42

Anti-SSA/Ro autoantibodies are classified as extractable nuclear antigens. The Anti-SSA/Ro autoantibody targets Ro proteins, namely Ro52 and Ro60. Ro52 and Ro60 were originally thought to be one protein, however current findings show that they are two functionally distinct proteins encoded by genes on separate chromosomes. Anti-SSA/Ro autoantibodies are used in clinical settings as a diagnostic tool to identify patients with SLE and Sjögren's disease... 54159e7d42 == Signs and symptoms == 54159e7d42 The lesions of systemic lupus erythematosus are characterized by their distribution, which can be either annular with central clearing or papulosquamous. The lesions normally heal without atrophy or scarring, and these two forms can happen at the same time... 54159e7d42 == Signs and symptoms == 54159e7d42

Anti-SSA/Ro autoantibodies Additionally, Anti-Ro/SSA can be found in other autoimmune diseases such as systemic sclerosis (SSc), polymyositis/dermatomyositis (PM/DM), rheumatoid arthritis (RA), and mixed connective tissue disease (MCTD), and are also associated with heart arrhythmia. such as systemic lupus erythematosus (SLE), SS/SLE overlap syndrome, subacute cutaneous lupus erythematosus (SCLE), neonatal lupus and primary biliary Anti-SSA autoantibodies (anti-Sjögren's-syndrome-related antigen A autoantibodies, also called anti-Ro, or similar names including anti-SSA/Ro, anti-Ro/SSA, anti-SS-A/Ro, and anti-Ro/SS-A) are a type of anti-nuclear autoantibodies that are associated with many autoimmune diseases, such as systemic lupus erythematosus (SLE), SS/SLE overlap syndrome, subacute cutaneous lupus erythematosus (SCLE), neonatal lupus and primary biliary cirrhosis. They are often present in Sjögren's disease (SS) 54159e7d42

Lupus erythematosus tumidus (LET) was reported by Henri Gougerot and Burnier R. in 1930. It is a photosensitive skin disorder, a different subtype of cutaneous lupus erythematosus (CLE) from discoid lupus erythematosus (DLE) or subacute CLE (SCLE). LET is usually found on sun-exposed areas of the body. Skin lesions are edematous, urticarialike annular papules and plaques. Topical corticosteroids are not effective as treatment for LET, but many will respond to chloroquine. LET resolves with normal skin, no residual scarring, no hyperpigmentation or hypopigmentation. Cigarette smokers who have LET may not respond very well to chloroquine. 54159e7d42 The characteristic

presentation of tumid lupus erythematosus is erythematous, edematous plaques that lack ulceration or scaling. In contrast to discoid lupus erythematosus (DLE), there is no atrophy, scarring, or follicular plugging. Skin exposed to the elements, such as the face, upper chest (V-neck distribution... 54159e7d42 Lesions of SCL E may have an annular (shaped like a ring) configuration, with raised red borders and central clearing. 54159e7d42
