Fahrenheit 8 + 32 f °F to k K: The Fahrenheit scale (°F) is a temperature scale based on one proposed in 1724 by the physicist Daniel Gabriel Fahrenheit (1686–1736). The other limit established was his best estimate of the average human body temperature, originally set at 90 °F, then 96 °F (about 2. It uses the degree Fahrenheit (symbol: °F) as the unit. degrees Fahrenheit, c the value in degrees Celsius, and k the value in kelvins: f °F to c °C: $c = f - 32/1.8$ c °C to f °F: $f = c \times 1.8 + 32$ 6 °F less than the modern value due to a later redefinition of the scale). Several accounts of how he originally defined his scale exist, but the original paper suggests the lower defining point, 0 °F, was established as the freezing temperature of a solution of brine made from a mixture of water, ice, and ammonium chloride (a salt) 1cc58f049e

Daniel Gabriel Fahrenheit Fahrenheit is also credited with producing the first successful mercury-in-glass thermometers, which were more accurate than the spirit-filled thermometers of his time and of a generally superior design. He was born in Poland to a family Daniel Gabriel Fahrenheit FRS (24 May 1686 – 16 September 1736) was a physicist, inventor, and scientific instrument maker. He was born in Poland to a family of German origin, although he spent much of his life in the Dutch Republic. The popularity of his thermometers also led to the widespread adoption of his Fahrenheit scale, with which they were provided. Gabriel Fahrenheit FRS (24 May 1686 – 16 September 1736) was a physicist, inventor, and scientific instrument maker. Fahrenheit significantly improved the design and manufacture of thermometers; his were accurate and consistent enough that different observers, each with their own Fahrenheit thermometers, could reliably compare temperature measurements with each other 1cc58f049e

For much of the 20th century, the Fahrenheit scale was defined by two fixed points with a 180 °F separation: the temperature at which pure water freezes was defined as 32 °F and the boiling point of water was defined to be 212 °F, both at sea level and under standard atmospheric pressure. It is now formally defined using the Kelvin scale. 1cc58f049e
