

Extreme Fatigue Headache And Nausea

Hypervitaminosis irritability, inability to focus)
Convulsions Fatigue Headache Flushing of skin
(associated with niacin (vitamin B3) overdose) Skin
Hypervitaminosis is a condition of abnormally high
storage levels of vitamins, which can lead to various
symptoms—whether physiological, such as pain,
nausea, and tachycardia, or psychological, such as
confusion, hyperactivity, and irritability—and even
to toxicity. Specific medical names of the different
conditions are derived from the given vitamin
involved: an excess of vitamin A, for example, is
called hypervitaminosis A. Hypervitaminoses are
primarily caused by fat-soluble vitamins (especially
D and A), as these are stored by the body for longer
than the water-soluble vitamins. and mood changes
(e. g db518c8b08

TCAs including protriptyline are also used to reduce
the incidence of recurring headaches such as
migraine, and for other types of chronic pain.

Myalgic encephalomyelitis/chronic fatigue
syndrome This "crash" can last hours, days or
several months. increased fatigue and is disabling.
It can also include flu-like symptoms, pain, cognitive
difficulties, gastrointestinal issues, nausea, and
sleep problems Myalgic encephalomyelitis/chronic
fatigue syndrome (ME/CFS) is a disabling chronic
illness. The hallmark symptom is post-exertional
malaise (PEM), a worsening of the illness that can
start immediately or up to days after even minor
physical or mental activity. Further common
symptoms include orthostatic intolerance—dizziness
or faintness when upright—and pain. People with

ME/CFS experience profound fatigue that does not go away with rest, as well as problems with sleep and memory or concentration db518c8b08

The cause of the disease is unknown. ME/CFS often starts after an infection, such as infectious mononucleosis, and the illness has a genetic risk factor that can also run in families. Studies find impairment in the nervous and immune systems, as well as in energy production. A diagnosis is established with the presence of clinical symptoms and systematic differential diagnosis, as there is no verified diagnostic laboratory test or imaging procedure available. db518c8b08 Protriptyline is available as 5 mg and 10 mg tablets. Doses range from 15 to 40 mg per day and can be taken in one daily dose or divided into up to four doses daily. Some people... db518c8b08

Combat stress reaction Also known as "combat fatigue", "battle fatigue", "operational exhaustion", or "battle/war neurosis", it has some overlap with the diagnosis of acute stress reaction used in civilian psychiatry. Preoccupation with minor issues and familiar tasks Indecision and lack of concentration Loss of initiative with fatigue Exhaustion Headaches Back pains Inability Combat stress reaction (CSR) or combat neurosis is acute behavioral disorganization as a direct result of the trauma of war. It is historically linked to shell shock and is sometimes a precursor to post-traumatic stress disorder db518c8b08

Altitude sickness Symptoms of altitude sickness may include headaches, vomiting, tiredness, confusion, trouble sleeping, and dizziness. People's bodies can respond to high altitude in different ways. activities. Chronic mountain sickness may occur after long-term exposure to high altitude. It is recommended that at high altitude any symptoms of headache, nausea, shortness of breath, or vomiting be

assumed to be altitude sickness. Altitude sickness, the mildest form being acute mountain sickness (AMS), is a harmful effect of high altitude, caused by rapid exposure to low amounts of oxygen at high elevation. Acute mountain sickness can progress to high-altitude pulmonary edema (HAPE) with associated shortness of breath or high-altitude cerebral edema (HACE) with associated confusion.

In the United States, amitriptyline/perphenazine is indicated for the treatment of patients with:

Bellergal Bellergal is a combination of levorotatory alkaloids of belladonna, ergotamine tartrate, and phenobarbital, used for the treatment of functional menopause, such as hot flashes and night sweat, drowsiness, flushing, nausea, vomiting, diarrhea, constipation, decreased sweating, visual disturbances, unusual fatigue or weakness, and dry mouth.

Common side effects of bellergal include drowsiness, flushing, nausea, vomiting, diarrhea, constipation, decreased sweating, visual disturbances, unusual fatigue or weakness, and dry mouth. Bellergal has a high potential for potentially serious drug interactions due to strong CYP3A4 inhibition by ergotamine. Ergotamine is a vasoconstrictive CYP3A4 substrate. Symptoms experienced by the partner can include stomach pain, back pain, indigestion, changes in appetite, weight gain, acne, diarrhea, constipation, headache, toothache, cravings, nausea, breast augmentation, breast growth, dry navel, hardening of the nipple, excessive earwax, and insomnia. A qualitative study listed 35 symptoms from Couvade literature, including gastrointestinal, genitourinary, respiratory, oral or dental, stiffening of the glutes...

Protriptyline is used primarily to treat depression and to treat the combination of symptoms of anxiety and depression. Like most antidepressants of this chemical and pharmacological class, protriptyline has also been used in limited numbers of patients to treat panic disorder, obsessive-compulsive disorder, attention-deficit/hyperactivity disorder, enuresis, eating disorders such as bulimia nervosa, cocaine dependency, and the depressive phase of bipolar disorder (manic-depressive) disorder. It has also been used to support smoking cessation programs.

Altitude sickness typically occurs only above 2,500 metres (8,000 ft), though some people are affected at lower altitudes. Risk factors include a prior episode of altitude sickness, a high degree of activity, and a rapid increase in elevation. Being physically fit does not decrease the risk. Diagnosis is based on symptoms and is supported for those who have more than a minor reduction in activities. It is recommended that at high altitude any symptoms of headache, nausea, shortness of breath, or vomiting be assumed to be altitude sickness. db518c8b08 Those who are entirely healthy and do not experience long periods of avitaminosis can avert vitamin overdose by not taking more than the normal or recommended amount listed on the container... db518c8b08

Couvade syndrome The labor pain symptom is commonly known as sympathy pain. These most often include major weight gain, altered hormone levels, morning nausea, and disturbed sleep patterns. In more extreme cases, symptoms can include labor pains, fatigue, postpartum depression, and nosebleeds. constipation, headache, toothache, cravings, nausea, breast augmentation, breast growth, dry navel, hardening of the nipple, excessive earwax, and insomnia Couvade syndrome, also called sympathetic pregnancy, is a proposed condition in which an expectant parent who is not

pregnant experiences some of the same symptoms and behavior as their pregnant partner db518c8b08

Bellergal was widely used during the 1970s and 1980s. Its limited efficacy on decreasing hot flashes frequency and severity were... db518c8b08

Amitriptyline/perphenazine In the United States amitriptyline/perphenazine is marketed by Mylan Pharmaceuticals Inc. and Remedy Repack Inc. Constipation Dry mouth Nasal congestion Increased appetite Weight gain Nausea Dizziness Headache Vomiting Unknown frequency adverse effects include Diarrhoea Alopecia Amitriptyline/perphenazine (Duo-Vil, Etrafon, Triavil, Triptafen) is a formulation that contains the tricyclic antidepressant amitriptyline and the medium-potency typical (first-generation) antipsychotic, perphenazine db518c8b08

Caffeine withdrawal Common symptoms include: Headache Irritability Depressed or low mood Fatigue or drowsiness Nausea or vomiting Difficulty concentrating In Caffeine withdrawal is a set of symptoms, behaviors, and physiological changes that can occur when an individual significantly reduces or stops consuming caffeine. Common sources of caffeine include coffee, tea, energy drinks, and certain over-the-counter medications. mild to severe. This condition typically arises in individuals who have regularly consumed caffeine over an extended period or in substantial amounts db518c8b08

Exercise intolerance Exercise intolerance is not a disease or syndrome in and of itself, but can result from various disorders. It also includes experiences of unusually severe post-exercise pain, fatigue, nausea, vomiting, or other negative effects. weakness or muscle fatigue; or exercise might

result in severe headache, nausea, dizziness, occasional muscle cramps or extreme fatigue, which would make Exercise intolerance is a condition of inability or decreased ability to perform physical exercise at the normally expected level or duration for people of that age, size, sex, and muscle mass db518c8b08

Caffeine withdrawal can present with a variety of symptoms, which may range from mild to severe. Common symptoms include: db518c8b08 Combat stress reaction is an acute reaction that includes a range of behaviors resulting from the stress of battle that decrease the combatant's fighting efficiency. The most common symptoms are fatigue, slower reaction times, indecision, disconnection from one's surroundings, and the inability to prioritize. Combat stress reaction is generally short-term and should not be confused with acute stress disorder, post-traumatic stress disorder, or other long-term disorders attributable to combat stress, although any of these may commence as a combat stress reaction. The US Army uses the term/initialism COSR (combat stress reaction) in official medical reports. This term can be applied to any stress reaction in the military unit environment. Many reactions look like symptoms... db518c8b08 Generally, toxic levels of vitamins stem from high supplement intake. Toxicities of fat-soluble vitamins can also be caused by a large intake of highly fortified foods, but natural foods in modest levels seldom deliver extreme or dangerous levels of these vitamins. The Dietary Reference Intake recommendations issued by the United States Department of Agriculture define a "tolerable upper intake level" for most vitamins. db518c8b08 The source of Couvade syndrome is a matter of debate. Some believe it to be a psychosomatic condition, while others believe it may have biological causes relating to hormone changes. db518c8b08

Protriptyline Uniquely among most of the TCAs, protriptyline tends to be energizing instead of sedating, and is sometimes used for narcolepsy to achieve a wakefulness-promoting effect. or neck; urinating less than usual or not at all; extreme thirst with headache, nausea, vomiting, and weakness; or feeling light-headed or fainting. Dry Protriptyline, sold under the brand name Vivactil among others, is a tricyclic antidepressant (TCA), specifically a secondary amine db518c8b08

== Signs and symptoms == db518c8b08

Belladonna, including atropine, hyoscyamine and scopolamine, are antimuscarinic agents. They block acetylcholine from binding to its receptors. It generally reduces the secretion of the body, including mouth, nose, and skin, causes drowsiness and other anticholinergic effects. Phenobarbital provides sedative and anesthetic effects through depressing the central nervous system. 24 Ergotamine constricts blood vessels in the brain and alleviates headache through stimulating alpha-1, dopamine and serotonin receptors. db518c8b08 In most cases, the specific reason that exercise is not tolerated is of considerable significance when trying to isolate the cause down to a specific disease.

Dysfunctions involving the pulmonary, cardiovascular or neuromuscular systems have been frequently found to be associated with exercise intolerance, with behavioural causes also playing a part. db518c8b08 The name derives from "couvade", a class of male pregnancy rituals. db518c8b08 Exercise in this context means physical activity, not specifically exercise in a fitness program. For example, a person with exercise intolerance after a heart attack may not be able to sustain the amount of physical activity needed to walk through a grocery store or to cook a meal. In a person who does not tolerate exercise well, physical activity may cause unusual breathlessness (dyspnea), muscle... db518c8b08 == Signs and

symptoms == db518c8b08 Sickness is prevented by gradually... db518c8b08 ME/CFS symptoms can improve or worsen over time, but a full recovery is uncommon. No therapies or medications are approved to treat the cause of the condition, and treatment or management... db518c8b08
