

Achilles Tendon Stretching Exercises

Verheyen referred to the mythological account... 58d9749307 == Haglund's deformity == 58d9749307 == Structure == 58d9749307

Outline of exercise Squat bend (full body stretch) Stretching – Ballistic stretching Dynamic stretching PNF stretching Static stretching Passive stretching Altitude training The following outline is provided as an overview of and topical guide to exercise: 58d9749307

Proposed interventions to treat tendinopathy have limited or no scientific evidence to support them, such as pre-exercise stretching, strengthening calf muscles, avoiding over-training, adjustment of running mechanics, and selection of footwear. Treatment is symptomatic and non-specific such as ice, non-steroidal antiinflammatory agents (NSAIDs), and physical therapy. People who are not satisfied with symptomatic treatment may be offered surgery... 58d9749307 == Background == 58d9749307 Exercise - any bodily activity that enhances or logs physical fitness and overall health and wellness. It is performed for various reasons including strengthening muscles and the cardiovascular system, honing athletic skills, weight loss or maintenance, as well as for the purpose of enjoyment. Frequent and regular physical exercise boosts the immune system, and helps prevent the "diseases of affluence" such as heart disease, cardiovascular disease, Type 2 diabetes, and obesity. 58d9749307 == Structure == 58d9749307 Tendons, like ligaments, are made of collagen. The difference is that ligaments connect bone to bone, while tendons connect muscle to bone. There are about 4,000 tendons in the adult human body. 58d9749307 A tendon is made of dense regular connective tissue, whose main cellular components are special fibroblasts called tendon cells (tenocytes). Tendon cells synthesize the tendon's extracellular matrix, which abounds with densely-packed collagen fibers. The collagen fibers run parallel to each other and are grouped into fascicles. Each fascicle is bound by an endotendineum, which is a delicate loose connective tissue containing thin collagen fibrils and elastic fibers. A set of fascicles is bound by an epitenon, which is a sheath of dense irregular connective tissue. The whole tendon is enclosed by a fascia. The space between the fascia and the tendon tissue is filled with the paratenon, a fatty loose connective tissue. Normal healthy tendons are anchored to bone by Sharpey's fibres... 58d9749307 The risk for the development of plantar fascia tears can be increased by certain factors which could include: 58d9749307 Rupture of the Achilles tendon usually occurs due to a sudden, forceful push-off movement, an abrupt dorsiflexion of the foot while the calf muscle is engaged, or direct trauma. Chronic degeneration of the tendon, often from tendinosis, also increases the likelihood of rupture. Common risk factors include fluoroquinolone or corticosteroid use, sudden increases in physical activity, inflammatory conditions such as rheumatoid arthritis, gout, and chronic overuse or improper training. Diagnosis is primarily based on clinical symptoms and physical examination, with imaging such as ultrasound or MRI used for confirmation when needed. 58d9749307

Tendon Tendon length is determined by genetic predisposition, and A tendon or sinew is a tough band of dense fibrous connective tissue that connects muscle to bone. jumping, it is beneficial to have longer than average Achilles tendon and a shorter calf muscle. It sends the mechanical forces of muscle contraction to the skeletal system, while withstanding tension 58d9749307

Haglund's syndrome back use arch supports or orthotic devices perform stretching exercises to prevent the Achilles tendon from tightening avoid running on hard surfaces and Haglund's syndrome is a group of signs and symptoms consisting of Haglund's deformity in combination with retrocalcaneal bursitis. It is often accompanied by Achilles tendinitis 58d9749307

Human leg There are thirty bones in each leg. Achilles tendon from experiencing further stress when walking and performing therapeutic stretches. The major bones are the femur (thigh bone), tibia (shinbone), and adjacent fibula. A few stretch modalities or eccentric exercises such The human leg is the lower limb of the human body, including the thigh, knee, lower leg, ankle, foot, or sometimes even the hip or buttock region 58d9749307

Legs are used for standing, many forms of human movement, recreation such as dancing, and constitute a significant portion of a person's mass. Evolution has led to the human leg's development into a mechanism specifically adapted for efficient bipedal gait. While the capacity to walk upright is not unique to humans, other primates can only achieve this for short periods and at a great expenditure of energy. In humans, female legs generally have greater hip anteversion and tibiofemoral angles, while male legs have longer femur and tibial lengths. 58d9749307

Achilles tendon These muscles, acting via the tendon, cause plantar flexion of the foot at the ankle joint, and (except the soleus) flexion at the knee. It serves to attach the plantaris, gastrocnemius (calf) and soleus muscles to the calcaneus (heel) bone. The Achilles tendon, or the heel cord, also known as the calcaneal tendon, is a tendon at the back of the lower leg, and is the thickest in the human body The Achilles tendon, or the heel cord, also known as the calcaneal tendon, is a tendon at the back of the lower leg, and is the thickest in the human body 58d9749307

Prevention may include stretching before activity and gradual progression of exercise intensity. Treatment may consist of surgical repair or conservative management. Quick return to weight bearing (within 4 weeks) appears acceptable and is often recommended. While surgery traditionally results in a small decrease in the risk of re... 58d9749307

Achilles tendon rupture Achilles tendon rupture is the breakage of the Achilles tendon at the back of the ankle. Symptoms include the sudden onset of sharp pain in the heel. A snapping sound may be heard as the tendon breaks and walking becomes difficult. A Achilles tendon rupture is the breakage of the Achilles tendon at the back of the ankle. Symptoms include the sudden onset of sharp pain in the heel 58d9749307

Plantar fascial rupture The plantar fascia is a connective tissue that spans across the bottom of the foot. activity/Overuse Hormone problems Lack of flexibility of the calf, Achilles tendon and the plantar fascia. The condition plantar fasciitis may increase the likelihood of rupture. A plantar fascial rupture may be mistaken for plantar fasciitis or even a calcaneal fracture. To allow for proper diagnosis, an MRI is often needed. Connective tissue disorders such as rheumatoid A plantar fascial rupture, is a painful tear in the plantar fascia 58d9749307

The Anterior Cruciate Ligament (ACL) is the ligament that keeps the knee stable. ACL damage is a very common injury, especially among athletes. ACL Reconstruction surgery is a common intervention. There are approximately 200,000 ACL tears occurring annually and between 100,000 and 300,000 reconstruction surgeries will be performed each year in the United States. Around \$500 million health care dollar will come from ACL injuries. ACL injuries can be categorized into groups- contact and non-contact based on the nature of the injury Contact injuries occur when a person or object come into contact with the knee causing the ligament to tear. ACL injuries are commonly non-contact injuries, which occur during rapid changes of velocity or direction, like pivoting, twisting... 58d9749307 Abnormalities of the Achilles tendon include inflammation (Achilles tendinitis), degeneration, rupture, and becoming embedded with cholesterol deposits (xanthomas). 58d9749307 == History == 58d9749307 Achilles tendinopathy is idiopathic, meaning the cause is not well understood. Theories of causation include overuse such as running, a lifestyle that includes little exercise, high-heel shoes, rheumatoid arthritis, and medications of the fluoroquinolone or steroid class. Diagnosis is generally based on symptoms and examination. 58d9749307 The Achilles tendon was named in 1693 after the Greek hero Achilles. 58d9749307 The part of the leg between the hip and the knee is called the thigh. The part between the knee and the ankle is called the lower leg, shank, crus, or in anatomy simply the leg. The lower leg includes the shin in the front and the calf at the back. 58d9749307

Anterior cruciate ligament reconstruction The patellar ligament, tibialis anterior tendon, or Achilles tendon may be recovered from a cadaver and Anterior cruciate ligament reconstruction (ACL reconstruction) is a surgical tissue graft replacement of the anterior cruciate ligament, located in the knee, to restore its function after an injury. The torn ligament can either be removed from the knee (most common), or preserved (where the graft is passed inside the preserved ruptured native ligament) before reconstruction through an arthroscopic procedure. start high repetition strength training exercises 58d9749307

Achilles tendinitis It is accompanied by alterations in the tendon's Achilles tendinitis, also known as Achilles tendinopathy, is soreness and irritation of the Achilles tendon. Stiffness of the ankle may also be present. It is accompanied by alterations in the tendon's structure and mechanical properties. Onset is generally gradual. The pain is typically worse at the start of exercise and decreases thereafter. Achilles tendinitis, also known as Achilles tendinopathy, is soreness and irritation of the Achilles tendon. The most common symptoms are pain and swelling around the back of the ankle 58d9749307

== Types of exercise == 58d9749307 The oldest known record of the tendon being named after Achilles was written in 1693 by the Flemish anatomist Philip Verheyen. In his widely used text Corporis Humani Anatomia he described the tendon's location and said that it was commonly called "the cord of Achilles." The tendon has been described as early as the time of Hippocrates, who described it as the "tendo magnus" (Latin for "great tendon") and by subsequent anatomists prior to Verheyen as "chorda Hippocratis" (Latin for "Hippocrates' string"). 58d9749307

Patellar tendinitis Patellar tendinitis, also known as jumper's knee, is an overuse injury of the tendon that straightens the knee. Symptoms include pain in the front of the knee 58d9749307
