The Jolof or Wolof Empire was a confederacy state that ruled parts of West Africa situated in modern-day Senegal, Mali, The Gambia and Mauritania from around the 12th century and was later known as the Jolof Kingdom. According to African food historian Fran Osseo-Asare, the origins of jollof rice can be traced to the area, where rice was grown; the original dish was known as thieboudienne or thiebou djeun, and contains rice, fish, shellfish and vegetables. If made with meat, it is called... Under its Geographical Indication (GI) tag, it is referred to as "Bhandara Chinnor Rice". == History == Wheat gluten is composed of mainly two types of proteins: the glutenins and the gliadins, which in turn can be divided into high molecular and low molecular glutenins and α/β , γ and Ω gliadins. Its homologous seed storage proteins, in barley, are referred to as hordeins... Chinnor rice is mainly produced in the Balaghat district of Madhya Pradesh known as Balaghat Chinnor for which GI tag was received in September 2021, although it is also produced in Bhandara, Maharashtra, for which a separate GI tag was claimed by Maharashtra in 2023. Geographically, Bhandara district is enveloped by Balaghat district on the north.

Coeliac disease disease, mainly affecting the small intestine. It is caused by an abnormal immune system response to gluten, a protein found in wheat and other grains such as Coeliac disease (Commonwealth English) or celiac disease (American English) is a chronic autoimmune disease, mainly affecting the small intestine. It is caused by an abnormal immune system response to gluten, a protein found in wheat and other grains such as barley and rye. Coeliac disease causes a wide range of symptoms and complications that can affect multiple organs outside the gastrointestinal tract

In French-speaking West Africa, a variation of the dish is known as riz au gras. The Senegalese version, thieboudienne, has been recognized by UNESCO as an intangible cultural heritage dish. Regional variations are a source of competition among

the countries of West Africa, and in particular between Nigeria and Ghana. In the 2010s this developed into a friendly rivalry known as the "Jollof wars". 55bf809d50 Glutens, especially Triticeae glutens, have unique viscoelastic and adhesive properties, which give dough its elasticity, helping it rise and keep its shape and often leaving the final product with a chewy texture. These properties, and its relatively low cost, make gluten valuable to both food and non-food industries. 55bf809d50 In addition, a gluten-free diet may, in at least some cases, improve gastrointestinal or systemic symptoms in diseases like irritable bowel syndrome, rheumatoid... 55bf809d50

While many reactions are caused by wheat proteins, allergenic components are also present in other biochemical forms. The most severe response is wheat-dependent exercise-induced anaphylaxis (WDEIA). WDEIA is attributed to an omega gliadin, which happens to be a relative of the protein that causes celiac disease. Symptoms include nausea, urticaria, and atopy. 55bf809d50

Gluten triticale. g. Gluten makes up 75–85% of the total protein in bread wheat. Gluten is a structural protein complex naturally found in certain cereal grains. The types of grains that contain gluten include all species of wheat (common wheat, durum, spelt, khorasan, emmer, and einkorn), barley, rye, and some cultivars of oat; moreover, cross hybrids of any of these cereal grains also contain gluten, e. The term gluten usually refers to the elastic network of a wheat grain's proteins, gliadin and glutenin primarily, which forms readily with the addition of water and often kneading in the case of bread dough. Rice A substantial amount of the rice produced in developing nations is lost after harvest through factors such as poor transport and storage. Only some 8% of rice is traded internationally. Rice is the seed of the grass species *Oryza sativa* (Asian rice)—or, less commonly, *Oryza glaberrima* (African rice). China, India, and Indonesia are the largest consumers of rice. Asian rice was domesticated in China some 13,500 to 8,200 years ago; African rice was domesticated independently in West Africa about 3,000 years ago. Rice contains no gluten; it provides protein but not all the essential amino acids needed for good health. Traditional rice polycultures such as rice-duck farming, and modern integrated pest management seek to control damage from pests in a sustainable way. Rice yields can be reduced by pests including insects, rodents, and birds, as well as by weeds, and by diseases such as rice blast. parboiled to make it easy to cook. Rice of different Rice is a cereal grain and, in its domesticated form, is the staple food of over half of the world's population, particularly in Africa and Asia. Rice has become commonplace in many cultures worldwide; in 2023, 800 million tons were produced, placing it third after sugarcane and maize

Whole grains are a source of carbohydrates, multiple nutrients and dietary fiber. 55bf809d50 As of 2017,

gluten-related disorders were increasing in frequency in different geographic areas. The increase might be explained by the popularity of the Western diet, the expanded reach of the Mediterranean diet (which also includes grains with gluten), the growing replacement of rice by wheat in many countries, the development in recent years of new types of wheat with a higher amount of cytotoxic gluten peptides, and the higher content of gluten in bread and bakery products, due to the reduction of dough fermentation time. However, a 2020 study by the Leibniz-Institute for Food... 55bf809d50

Wheat allergy may be a misnomer. There are many allergenic components in wheat (for example: serine protease inhibitors, glutelins and prolamins), with different responses attributed to different components. Twenty-seven potential wheat allergens have been identified. 55bf809d50 The origin of glutinous rice is difficult to ascertain because of its long-standing cultural importance across a wide geographical region in Asia. 55bf809d50 The classic form of the disease can affect any age group, but is usually diagnosed in early childhood and causes symptoms of malabsorption such as weight loss, diarrhoea, and stunted growth. Non-classic coeliac disease is more commonly seen in adults, characterised by vague abdominal symptoms and complications in organs outside the gastrointestinal tract, such as bone disease, anaemia, and other consequences of nutritional deficiencies. In people with a genetic predisposition to the condition, eating gluten causes inflammation in the small intestine, damaging its lining and leading to malabsorption. The development of coeliac disease is believed to be influenced by other environmental factors, such as infections. 55bf809d50

symptoms for those with gluten-related disorders, including coeliac disease (CD), non-coeliac gluten sensitivity (NCGS), and wheat allergy. In these people, the gluten-free diet is demonstrated as an effective treatment, but studies show that up to 79% of the people with coeliac disease have an incomplete recovery of the small bowel, despite a strict gluten-free diet. This is mainly caused by inadvertent ingestion of gluten. People with a poor understanding of a gluten-free diet often believe that they are strictly following the diet, but are making regular errors. 55bf809d50
