After ovulation, during the luteal phase, the egg will be available to be fertilized by sperm. If it is not, it will break down in less than a day. Meanwhile, the uterine lining (endometrium) continues to thicken to be able to receive a fertilized egg. If no conception occurs, the uterine lining will eventually break down and be shed from the body via the vagina during menstruation. 82830ba341 == Terminology == 82830ba341

Pregnancy tests using animals Before these accessible and convenient test kits were invented, scientists strived to discover a way in spotting pregnancy-related hormones by a natural, simple test, where animals were often included as clinical tools to facilitate the process. later, results could be seen. Advancements in

medical technology have enabled women to accurately check their pregnancy status by using 'pee-on-a-stick' pregnancy test kits at home. If the woman was pregnant, then the frog would be ovulating, and a small cluster of eggs could be seen at the rear end of Before immunological pregnancy tests were developed in the 1960s, women relied on urine-based pregnancy tests using animals, ranging from mice to frogs 82830ba341

Human chorionic gonadotropin The pituitary analogue of hCG, luteinizing hormone (LH), is produced in the pituitary gland of males and females of all ages. The presence of hCG is detected in some pregnancy tests (HCG pregnancy strip tests). Some cancerous tumors produce this hormone; therefore, elevated levels measured when the patient is not pregnant may lead to a diagnosis of cancer and, if high enough, of paraneoplastic syndromes. Because of its similarity to LH, hCG can also be used clinically to induce ovulation in the ovaries as well as Human chorionic gonadotropin (hCG) is a hormone for the maternal recognition of pregnancy produced by trophoblast cells that are surrounding a growing embryo (syncytiotrophoblast initially), which eventually forms the placenta after implantation. hyperemesis gravidarum in pregnant women. Throughout history, there have been different animal-based tests with the aim of indicating the pregnancy status of women. The most well known test is the Hogben test, prevalent from the 1940s to the 1960s, by using the underlying principle of hormones and its subsequent biological response in both sexes of certain frog species. The Galli-Mainini test is another frog test developed based on similar principles. 82830ba341 LFTs operate on the same principles of affinity chromatography as the enzyme-linked immunosorbent assays (ELISA). In essence, these tests run the liquid sample along the surface of a pad with reactive molecules that show a visual positive or negative result. The pads are based on a series of capillary beds, such as pieces of porous paper, microstructured polymer, or sintered polymer. Each of these pads has the capacity... 82830ba341

Lateral flow test LFTs are widely used in medical diagnostics in the home, at the point of care, and in the laboratory. It is a simple device intended to detect the presence of a target substance in a liquid sample without the need for specialized

These tests are simple and economical and generally show results in around five to thirty minutes. "Concurrent engineering for A lateral flow test (LFT), is an assay also known as a lateral flow immunochromatographic test (ICT). For instance, the home pregnancy test is an LFT that detects a specific hormone. biomarker for pre-eclampsia. Some people choose to track ovulation in order to improve or aid becoming pregnant by timing intercourse with their ovulation. The signs of ovulation may include cervical mucus changes, mild cramping in the abdominal area, and a small rise in basal body temperature. Medication is also sometimes required by those experiencing infertility to induce ovulation. 82830ba341 Symptoms-based methods involve tracking one or more of the three primary fertility signs: basal body temperature, cervical mucus, and cervical position. Other signs may also be observed: these include breast tenderness and mittelschmerz (ovulation pains), urine analysis strips known as ovulation predictor kits (OPKs), and microscopic examination of saliva or cervical fluid. Also available are computerized fertility monitors. 82830ba341 Usually a horse is considered "bred" where it is born, not where a mating takes place, though some breeds denote the country or state where conception took place as the origin of the foal. HIV and pregnancy This topic is important because the risk of viral transmission can be significantly reduced with appropriate medical intervention, and without treatment HIV/AIDS can cause significant illness and death in both the mother and child. occurs at ovulation, via ovulation test kits and consultation with clinical experts can maximize the chance for conception. This is exemplified by data from The Centers for Disease Control (CDC): In the United States and Puerto Rico between the years of 2014–2017, where prenatal care is generally accessible, there were 10,257 infants in the United States and Puerto Rico who were exposed to a maternal HIV infection in utero who did not become infected and 244 exposed infants who did become infected. There is a risk of HIV transmission from mother to child in three primary situations: pregnancy, childbirth, and while breastfeeding. The male parent of a horse, a stallion, is commonly known as its sire and the female parent, the mare, is called its dam. A "foal" is a newly born or very young horse of either sex, a "colt" is a young male horse, and a "filly" is a young female. Though many horse owners might breed their mare to a local stallion in order to produce a companion animal, most professional breeders use selective breeding to produce horses of a given type or breed. 82830ba341 == Process == 82830ba341

Signs and symptoms of early pregnancy may include missed periods, tender breasts, morning sickness (nausea and vomiting), hunger, implantation bleeding, and frequent urination. Pregnancy may be confirmed with a pregnancy test. Methods of contraception are used to avoid pregnancy. 82830ba341 There is no universally accepted definition of the term. Thus in IVF pregnancy rates may be based on initiated treatment cycles, cycles that underwent oocyte retrieval, or cycles where an embryo transfer was performed. In terms of outcome, "pregnancy" may refer to a positive pregnancy test, evidence of a pregnancy with a "viable" fetus or implantation. Furthermore, pregnancy rates can be influenced in IVF by transferring multiple embryos that may result in multiple births. A strict definition in the IVF setting would refer to the singleton pregnancy rate that determines how

Pregnancy test occur as soon as 6 days following ovulation and on average 8-10 days following ovulation; this is the earliest hCG can be detected in a blood sample. The A pregnancy test is used to determine whether a woman is pregnant or not. The two primary methods are testing for the pregnancy hormone (human chorionic gonadotropin (hCG)) in blood or urine using a pregnancy test kit, and scanning with ultrasonography. Testing blood for hCG results in the earliest detection of pregnancy. procedures. A pregnancy may end in a live birth, a miscarriage, an induced abortion, or a stillbirth. Childbirth typically occurs around 40 weeks from the start of the last menstrual period (LMP), a span known as the gestational age; this is just over nine months. Counting by fertilization age, the length is about 38 weeks. Implantation occurs on average 8-9 days after fertilization. An embryo is the term for the developing offspring during the first seven weeks following implantation (i.e. ten weeks' gestational age), after which the term fetus is used until the birth of a baby. 82830ba341 Human chorionic gonadotropin is a glycoprotein composed of 237 amino acids with a molecular mass of 36.7 kDa, approximately 14.5kDa α hCG and 22.2kDa β hCG. 82830ba341
