People often benefit from pulmonary rehabilitation and supplemental... Since its development in the 1970s, CT scanning has proven to be a versatile imaging technique. While CT is most prominently used in medical diagnosis, it can also be used to form images of non-living objects. The 1979 Nobel Prize in Physiology or Medicine was awarded jointly to British electrical engineer Godfrey Hounsfield and South African-American physicist Allan MacLeod Cormack "for the development... The cause is unknown, hence the term idiopathic. Risk factors include cigarette smoking, gastroesophageal reflux disease, certain viral infections, and genetic predisposition. The underlying mechanism involves scarring of the lungs. Diagnosis requires ruling out other potential causes. It may be supported by a high resolution CT scan or lung biopsy which show usual interstitial pneumonia. It is a type of interstitial lung disease. Symptoms typically include gradual onset of shortness of breath and a dry cough. Other changes may include feeling tired, and clubbing (abnormally large and dome shaped finger and toenails). Complications may include pulmonary hypertension, heart failure, pneumonia or pulmonary embolism. CT scanners use a rotating X-ray tube and a row of detectors placed in a gantry to measure X-ray attenuations by different tissues inside the body. The multiple X-ray measurements taken from different angles are then processed on a computer using tomographic reconstruction algorithms to produce tomographic (cross-sectional) images (virtual "slices") of a body. CT scans can be used in patients with metallic implants or pacemakers, for whom magnetic resonance imaging (MRI) is contraindicated.

Idiopathic pulmonary fibrosis It is a type of chronic pulmonary fibrosis characterized by a progressive and irreversible decline in lung function. As crackles Idiopathic pulmonary fibrosis (IPF), formerly known as cryptogenic fibrosing alveolitis, is a rare, progressive illness of the respiratory system, characterized by the thickening and stiffening of lung tissue, that surrounds the air sacs, and is associated with the formation of scar tissue. this should raise the suspicion of IPF and lead to consideration of an HRCT scan of the chest which is more sensitive than a chest X-ray
