Individuals with GAD often have other disorders including other psychiatric disorders, substance use disorder, or obesity, and may have a history of trauma or family with GAD. Clinicians use screening tools such as the GAD-7 and GAD-2 questionnaires to determine if individuals may have GAD and warrant formal evaluation for the disorder. In addition, screening tools may enable clinicians to evaluate the severity of GAD symptoms. 314e0de9c0 SSRIs are the most widely prescribed antidepressants in many countries. In adults, they are recommended as a first-line treatment for moderate to severe depression, while for mild depression non-drug treatments are preferred unless the patient chooses medication. Serotonin-norepinephrine reuptake inhibitor These neurotransmitters are thought to play an important role in mood regulation. Off-label uses include treatments for attention deficit hyperactivity disorder (ADHD) and obsessive-compulsive disorder (OCD). SNRIs can be contrasted with the selective serotonin reuptake inhibitors (SSRIs) and norepinephrine reuptake inhibitors (NRIs), which act upon single neurotransmitters. SNRIs are monoamine reuptake inhibitors; specifically, they inhibit the reuptake of serotonin and norepinephrine. In 2009, Cymbalta and Effexor were the 11th- and 12th-most-prescribed branded drugs in the United States Serotonin-norepinephrine reuptake inhibitors (SNRIs) are a class of antidepressant medications used to treat major depressive disorder (MDD), anxiety disorders, chronic neuropathic pain, fibromyalgia, and menopausal symptoms. among the most widely used antidepressants today. Depression in childhood and adolescence is similar to adult major depressive disorder, although young sufferers may exhibit increased irritability or behavioral dyscontrol instead of the more common sad, empty, or hopeless feelings that are seen with adults. Children who are under stress, experiencing loss or grief, or have other underlying disorders are at a higher risk for depression. Depression in young people is often comorbid with mental disorders outside of other mood disorders, most commonly anxiety disorders, especially social anxiety disorder, and conduct disorder. Depression also tends to run in families. The National Alliance on Mental Illness reports that 75 percent of mental health disorders commence by age 24. In a 2016 Cochrane review, cognitive behavior...

Marketed SSRIs include six main antidepressants—citalopram,
