Common side effects include cough, dizziness, and swelling. Serious side effects may include angioedema, myocardial infarction, high blood potassium, liver problems, and low blood pressure. Use in pregnancy is not recommended. Amlodipine works by increasing the size of arteries while benazepril works by decreasing renin-angiotensin-aldosterone system activity. eb2d789333 The combination was approved for medical use in the European Union in 2008. The combination on the World Health Organization's List of Essential Medicines. While it is available in India and the European Union it is not available in Canada, Australia, or the United States as of 2019. eb2d789333 Amlodipine blocks the transmembrane influx of calcium into the vascular and cardiac smooth muscles resulting in vasodilation and hence a fall in blood pressure. Levamlodipine is an allosteric modulator and acts on the L-type of calcium channels. Receptor binding studies have shown that out of the two forms only the (S)-enantiomer of amlodipine binds to and blocks L-type calcium channels whereas the (R)-enantiomer has no activity on these channels. eb2d789333 It was approved for medical use in the United States in May 2018. eb2d789333
