Abortion Abortion is the termination of a pregnancy by removal or expulsion of an embryo or fetus. Common reasons for inducing an abortion are birth-timing and limiting family size. The unmodified word abortion generally refers to induced abortion, or deliberate actions to end a pregnancy. Abortion occurring without intervention is known as spontaneous abortion or "miscarriage", and occurs in roughly 30–40% of all pregnancies. Other reasons include maternal health, an inability to afford a child, domestic violence, lack of support, feelings of being too young, wishing to complete an education or advance a career, and not being able, or willing, to raise a child conceived as a result of rape or incest. The earliest responses to sound have been observed at around 16 weeks of gestation, while the auditory system is considered fully functional between 25 and 29 weeks of gestation. Between 33 and 41 weeks of gestation, the fetus is able to distinguish its mother’s voice from those of others. The management of labor and delivery may vary depending on the gestational age. It is common to encounter the following terms when describing different time periods of pregnancy. == Etymology == The word fetus (plural fetuses or rarely, the solecism feti) comes from Latin fētus 'offspring, bringing forth, hatching of young'. Fetal macrosomia and LGA often do not present with noticeable patient symptoms. Important signs include large fundal height (uterus size) and excessive amniotic fluid (polyhydramnios). Excessive amniotic fluid indicates that... == Signs and symptoms == Generally speaking, fetal motility can be classified as either elicited or spontaneous, and spontaneous movements may be triggered by either the spine or the brain. Whether a movement is supraspinally determined can be inferred by comparison to movements of an anencephalic fetus. When done legally in industrialized societies, induced abortion is one of the safest procedures in medicine. Modern methods use medication or surgery for abortions. The drug mifepristone (aka RU-486) in combination with prostaglandin appears to be as safe and effective as surgery during the first and second trimesters of pregnancy. Self-managed medication abortion is highly effective and safe throughout the first trimester. The most common surgical technique involves dilating the cervix and using...
