The paronychium is the site of hangnails, ingrown nails, and paronychia, a skin infection. Fingernails and toenails are made of a tough rigid protein called alpha-keratin, a polymer also found in the claws, hooves, and horns of vertebrates

Surgical treatment of ingrown toenails typically a partial avulsion of the nail plate, known as a wedge resection, or a complete removal of the toenail. If the ingrown toenail recurs despite this Surgical treatments of ingrown toenails include a number of different options. As an alternative, one may use 10% sodium hydroxide which is less toxic or trichloroacetic acid which may give faster healing time. The initial surgical approach is typically a partial avulsion of the nail plate, known as a wedge resection, or a complete removal of the toenail. Antibiotics typically are not needed when surgery is performed. If conservative treatment of a minor ingrown toenail does not succeed or if the ingrown toenail is severe, surgical management by a podiatrist is recommended. If the ingrown toenail recurs despite this treatment, destruction of the germinal matrix with phenol is recommended

'nail'; and κρυπτός, kruptós, 'hidden') is a common form of nail disease. While any nail can become ingrown, wearing shoes causes the toenails to grow in more often 3a69762d8e

A common misconception is that the cause of an ingrown toenail is the nail growing into the paronychia, but it can also be caused by overgrown toe skin. The condition is caused by a microbial inflammation of the paronychia causing a granuloma within which the nail is buried. A true ingrown toenail is caused by actual penetration of flesh by a sliver of toenail. 3a69762d8e == Signs and symptoms == 3a69762d8e
