Trigeminal nerve Its name (trigeminal, from Latin tri- 'three' and -geminus 'twin') derives from each of the two nerves (one on each side of the pons) having three major branches: the ophthalmic nerve (V1), the maxillary nerve (V2), and the mandibular nerve (V3). Touch-position input comes to attention immediately, but pain-temperature In neuroanatomy, the trigeminal nerve (lit. The ophthalmic and maxillary nerves are purely sensory, whereas the mandibular nerve supplies motor as well as sensory (or "cutaneous") functions. triplet nerve), also known as the fifth cranial nerve, cranial nerve V, or simply CN V, is a cranial nerve responsible for sensation in the face and motor functions such as biting and chewing; it is the most complex of the cranial nerves. Adding to the complexity of this nerve is that autonomic nerve fibers as well as special sensory fibers (taste) are contained within it. The two basic types of sensation are touch-position and pain-temperature. opposite side 733a17c3bc

In late 1979, Johnston wrote the song "Lazy", the only song he wrote during that period after dropping out of Abilene Christian University in West Texas. In 1980, he enrolled in Kent State University in East Liverpool, Ohio, where he met Laurie Allen, who would become something of a muse for Johnston. Moonsault Much of its popularity in both Japanese and American wrestling is attributed to Keiji Muto, also known as the Great Muta. variations exist, such as a belly-to-belly version used by Matt Sydal. This version which sees him holding the opponent in a belly-to-belly position while performing A moonsault, moonsault press, or back flip splash is a professional wrestling aerial technique. In a standard moonsault, which is generally attempted from the top rope, a wrestler faces away from the supine opponent and executes a backflip landing on the opponent in a splash/press position but facing towards the elevated position. Though this move is generally attempted from the top rope to an opponent lying face up in the mat, myriad variations exist, including moonsaults that see the wrestler land on a standing opponent and forcing them down to the mat. The move is considered a higher-impact version of a splash, since the wrestler utilizes rotational speed. It was innovated by Mando Guerrero 733a17c3bc

They are used above all when detainees are to be restrained over a longer period of time, for example during transport or at court hearings. When using a belly chain, the hands are cuffed to the chain. Belly chains are used because there still remains a relatively large freedom of movement to the detainee when their hands are cuffed in front of the body. This method is used as an alternative to cuffing the hands behind the detainee's back, which inflicts discomfort and pain over long periods of time. 733a17c3bc

In humans, the abdomen stretches from the thorax at the thoracic diaphragm to the pelvis at the pelvic brim. The pelvic brim stretches from the lumbosacral joint (the intervertebral disc between L5 and S1) to the pubic symphysis and is the edge of the pelvic inlet. The space above this inlet and under the thoracic diaphragm is termed the abdominal cavity. The boundary of the abdominal cavity is the abdominal wall in the front and the peritoneal surface at the rear.

733a17c3bc The motor division of the trigeminal nerve derives from the basal plate of the embryonic pons, and the sensory division originates in the cranial neural crest. Sensory information from the face and body is processed by parallel pathways in the central nervous system. 733a17c3bc
