Non Diabetic

Common side effects include low blood sugar, nausea, dizziness, abdominal pain, and pain at the site of injection. Other serious side effects may include medullary thyroid cancer, angioedema, pancreatitis, and kidney injury. Use in pregnancy and breastfeeding is of unclear safety. Exenatide is a glucagon-like peptide-1 receptor agonist (GLP-1 receptor agonist) also known as incretin mimetics. It works by increasing insulin release from the pancreas and decreases excessive glucagon release.

The most common side effects of tirzepatide include nausea, vomiting, diarrhea, decreased appetite,

constipation, upper abdominal discomfort, and abdominal pain. Developed by Eli Lilly and Company, tirzepatide was approved for treatment of T2D in the US in May 2022, in the European Union in September 2022, in Canada in November 2022, and in Australia in December 2022. The US Food and Drug Administration (FDA) considers it a first-in-class medication. The FDA approved it for weight loss in November 2023. Also in November 2023, the UK Medicines and Healthcare products Regulatory Agency revised the indication for tirzepatide (as Mounjaro) to include weight management and weight loss. In December 2024, the FDA revised the indication... ce98394891 A 2011 Cochrane review... ce98394891 Type 1 diabetes is an endocrine disorder characterized by hyperglycemia due to autoimmune destruction of insulin-secreting pancreatic beta cells. Insulin is a hormone needed by cells to take in glucose from the blood. Insufficient levels of insulin due to Type 1 diabetes can lead to chronic hyperglycemia and eventual multiorgan damage, resulting in renal, neurologic, cardiovascular, and other serious complications. The

treatment for Type 1 diabetes involves regular insulin injections. ce98394891 Originally developed to treat type 2 diabetes, some GLP-1 agonists have been approved to treat obesity. They mimic the actions of the endogenous incretin hormone GLP-1, which is released in the small intestine and can inhibit glucagon release and increase insulin secretion. ce98394891

GLP-1 receptor agonist Incretin mimetics are substances that mimic the actions of incretin hormones such as GLP-1 and GIP. Glucagon-like peptide-1 (GLP-1) receptor agonists, also known as GLP-1 agonists, GLP-1RAs, and informally as simply GLP-1s, are a class of medications Glucagon-like peptide-1 (GLP-1) receptor agonists, also known as GLP-1 agonists, GLP-1RAs, and informally as simply GLP-1s, are a class of medications that activate the GLP-1 receptor, causing reduced blood sugar, reduced appetite, and reduced energy intake. GLP-1 analogs are molecules that are structurally almost identical to the endogenous GLP-1 hormone ce98394891

Alongside glucose-dependent insulinotropic peptide (GIP), GLP-1 is an incretin; thus, it has the ability to decrease blood sugar levels in a glucose-dependent manner by enhancing the secretion of insulin. Beside the insulinotropic effects, GLP-1 has been associated with numerous regulatory and protective effects. Unlike GIP, the action of GLP-1 is preserved in patients with type 2 diabetes. Glucagon-like peptide-1 receptor agonists gained approval as drugs to treat diabetes and obesity starting in the 2000s. ce98394891 GLP-1 receptor agonists are used to treat type 2 diabetes and obesity, and are under study for treatment of metabolic dysfunction-associated steatotic liver disease, polyendocrine metabolic ovarian syndrome, and diseases of the reward system, such as addictions (especially from ultra-processed foods). ce98394891 Exenatide is used to treat type 2 diabetes as an add-on to metformin, a biguanide, or a combination of metformin and a sulfonylurea, or thiazolidinediones such as pioglitazone. ce98394891 Liraglutide was approved for medical use in the

Glucagon-like peptide-1 intake. Active GLP-1 protein secondary structure includes two α -helices from amino acid position 13–20 and 24–35 separated by a linker region. The initial product GLP-1 (1–37) is susceptible to amidation and proteolytic cleavage, which gives rise to the two truncated and equipotent biologically active forms, GLP-1 (7–36) amide and GLP-1 (7–37). Consequently, diabetic subjects treated with GLP-1 receptor agonists often experience weight loss as opposed to the weight gain commonly induced Glucagon-like peptide-1 (GLP-1) is a 30- or 31-amino-acid-long peptide hormone deriving from tissue-specific posttranslational processing of the proglucagon peptide. It is produced and secreted by intestinal enteroendocrine L-cells and certain neurons within the nucleus of the solitary tract in the brainstem upon food consumption ce98394891

Anti-obesity medication These medications alter one of the fundamental processes of weight regulation, by: reducing appetite and consequently energy intake, increasing energy expenditure, redirecting

nutrients from adipose to lean tissue, or interfering with the absorption of calories. As of 2023, the medications liraglutide, naltrexone/bupropion Anti-obesity medication or weight loss medications are pharmacological agents that reduce excess body fat and cause weight loss. stimulants such as amphetamines, in the early 2020s, GLP-1 receptor agonists became popular for weight loss ce98394891
