Lyme disease Infection is treatable with antibiotics. It is the most common disease spread by ticks in the Northern Hemisphere. Infections are most common in the spring and early summer. It is the Lyme disease, also known as Lyme borreliosis, is a tick-borne disease caused by species of Borrelia bacteria, transmitted by blood-feeding ticks in the genus Ixodes. Early detection and prompt treatment are associated with more favorable outcomes. Most treated patients experience a full recovery. known as Lyme borreliosis, is a tick-borne disease caused by species of Borrelia bacteria, transmitted by blood-feeding ticks in the genus Ixodes. Ticks are external parasites, living by feeding on the blood of mammals, birds, and sometimes reptiles and amphibians. Ticks are widely distributed around the world, especially in warm, humid climates. The timing of the origin of ticks is uncertain, though the oldest known tick fossils are around 100 million years old, and come from the Cretaceous period. Dogs and the modern gray wolf share a common ancestor. Due to their long association with humans, dogs have gained the ability to thrive on a starch-rich diet that would be inadequate for other canids. Dogs were the first species to be domesticated over 14,000 years ago, before the development of agriculture, though genetic studies suggest the domestication process may have begun over 25,000 years ago. Also called the domestic dog, it was selectively bred during the Late Pleistocene by hunter-gatherers 778e42eec5

Nuttalliella, a genus of tick from southern Africa, is the only living member of the family Nuttalliellidae, which represents the most primitive living lineage of ticks. Adults have ovoid/pear-shaped bodies (idiosomas) which become engorged with blood when they feed, and eight legs. Their cephalothorax and abdomen are completely fused. In addition to having a hard shield on their dorsal surfaces, known as the scutum, hard ticks have a beak-like structure at the front containing the mouthparts, whereas soft ticks...

Anaplasmosis Also referred to as "yellow bag" or "yellow fever" because the infected animal can develop a jaundiced look, other signs of infection include weight loss, diarrhea, paleness of the skin, aggressive behavior, and high fever. Anaplasma phagocytophilum is also found worldwide, mainly transmitted by Ixodes ticks. transmitted by Rhipicephalus ticks. Anaplasmosis is an infectious but not contagious disease transmitted through mechanical and biological vector processes. Other species that cause anaplasmosis Anaplasmosis is a tick-borne disease affecting ruminants, dogs, and horses, and is caused by Anaplasma bacteria 778e42eec5

== Premise == 778e42eec5 Many different tick species can carry the bacteria that cause anaplasmosis. The two major bacterial pathogens are Anaplasma marginale and Anaplasma phagocytophilum. These microorganisms are Gram-negative, and infect red blood cells. Once the host is infected with anaplasmosis, the immune system will try to fight off and kill the infected red blood cells, but will also kill healthy red blood cells. The Anaplasma sparouinense species is responsible for a rare zoonosis, the Sparouine anaplasmosis, detected only in French Guiana, South America. This disease was described from a clandestine gold miner working deep in rainforest. Infection of his red blood cells led to a severe deterioration of his health and required his hospitalization.... 778e42eec5

Tick paralysis Unlike other tick-borne diseases, the illness is caused by a neurotoxin produced in the tick's salivary gland. People can experience severe respiratory distress (similar to anaphylaxis). Unlike other tick-borne Tick paralysis is a type of paralysis caused by specific types of ticks reported mostly from the Americas, Asia, and Australia. Tick paralysis is a type of paralysis caused by specific types of ticks reported mostly from the Americas, Asia, and Australia. After prolonged attachment, the engorged tick transmits the toxin to its host, causing an ascending paralysis resembling Guillain-Barre syndrome. The diagnosis is entirely clinical, and treatment after tick removal is supportive. The incidence of tick paralysis is unknown 778e42eec5

Dermacentor ticks may also induce tick paralysis by elaboration of a neurotoxin that induces rapidly progressive flaccid quadriplegia similar to Guillain-Barré syndrome. The neurotoxin prevents presynaptic release of acetylcholine from neuromuscular... 778e42eec5

The rash is typically neither itchy nor painful. Approximately 70–80% of infected people develop a rash. Other early symptoms may include fever, headaches and tiredness. If untreated, symptoms may include loss of the ability to move one or both sides of the face, joint pains, severe headaches with neck stiffness or heart palpitations. Months to years later, repeated episodes of joint pain and swelling may occur. Occasionally, shooting pains or tingling in the arms and... 778e42eec5 Its pilot premiered on August 18, 2016. A "half-season", through to the sixth episode, was released on August 25, 2017, and another six episodes were released on February 23, 2018. On January 17, 2018, Amazon ordered a second season of ten episodes, which premiered on April 5, 2019. A month later, Edlund revealed on Twitter that Amazon Video declined to renew the series for a third season. In June 2019, Edlund said that he was unable to find a "new home" for The Tick, ending the series with two seasons. 778e42eec5 Tick paralysis results from injection of a toxin from tick salivary glands during a blood meal after being attached for 3 to 7 days, causing fatigue within and weakness in both legs that progresses to paralysis. Deep tendon reflexes are usually decreased or absent. The paralysis ascends to the trunk, arms, and head, and may lead to respiratory failure and death. The disease can present as acute ataxia without muscle weakness. People may have minor sensory symptoms, such as local numbness, but no fever or headache or change in mental status. 778e42eec5 Though D. variabilis may be exposed to Borrelia burgdorferi, the causative agent of Lyme disease, these ticks are not competent vectors for the transmission of this disease. The primary vectors for B. burgdorferi are the deer ticks Ixodes scapularis in eastern parts of the United States, Ixodes pacificus in California and Oregon, and Ixodes ricinus in Europe. D. variabilis may also carry Anaplasma phagocytophilum, the causative agent of human granulocytic anaplasmosis, and Ehrlichia chaffeensis, the causative agent of human monocytic ehrlichiosis. 778e42eec5
