Ixodes holocyclus It is usually found in a 20-kilometre wide band following the eastern coastline of Australia. Because the same area includes Australia's most densely populated regions, bites on people, pets and livestock are relatively common. Larvae search for a blood meal from a host, feed *Ixodes holocyclus*, commonly known as the Australian paralysis tick, is one of about 75 species in the Australian tick fauna and is considered the most medically important. Within that range, *Ixodes holocyclus* is the tick most frequently encountered by humans and their pets. Ticks hatch as six-legged larvae after an incubation period of 40 to 60 days. It can cause paralysis by injecting neurotoxins into its host. is a "three-host tick" 66ace64486

Ticks are external parasites, living by feeding on the blood of mammals, birds, and sometimes reptiles and amphibians. The timing of the origin of ticks is uncertain, though the oldest known tick fossils are around 100 million years old, and come from the Cretaceous period. Adult ticks are approximately 3 to 5 mm in length depending on age, sex, and species, but can become larger when engorged. They are part of the mite superorder Parasitiformes. Ticks are widely distributed around the world, especially in warm, humid climates. Ticks belong to two major families: the Ixodidae, or hard ticks, and the Argasidae, or soft ticks 66ace64486

Host (biology) More specifically in botany, a host plant supplies food resources to micropredators, which have an evolutionarily stable relationship with their hosts similar to ectoparasitism. g. nematodes), cells harbouring pathogenic (disease-causing) viruses, or a bean plant hosting mutualistic (helpful) nitrogen-fixing bacteria. A parasite may have a long-term relationship In biology and medicine, a host is a larger organism that harbours a smaller organism; whether a parasitic, a mutualistic, or a commensalist guest (symbiont). The host range is the collection of hosts that an organism can use as a partner. organisms live in close association with a host and only become parasitic when environmental conditions deteriorate. Examples include animals playing host to parasitic worms (e. The guest is typically provided with nourishment and shelter 66ace64486

In 1980, Michaels left the show to explore other opportunities. He was replaced by Jean Doumanian, who was then replaced by Ebersol after a season of poor reviews. Ebersol ran the show until 1985, when Michaels returned... 66ace64486 == Hosts == 66ace64486 From its launch in 2008 through 2025, the podcast consistently appeared in the Top 10 rankings on Apple Podcasts and Spotify, indicating that it's one of the most popular podcasts in the world. On October 3, 2018, the podcast started releasing additional short episodes titled Short Stuff, where they cover topics that don't warrant the length of a full episode (e.g. "Killing a Dead Body"). A number of other types of media, including a TV show and books, have been spun off by the podcast. 66ace64486 Babesia comprises more than 100 species of tick-borne parasites that infect erythrocytes (red blood cells) in many vertebrate hosts. 66ace64486 There are six major parasitic strategies of exploitation of animal hosts, namely parasitic castration, directly transmitted parasitism (by contact), trophically-transmitted parasitism (by being eaten), vector-transmitted parasitism, parasitoidism, and micropredation. One major axis of classification concerns invasiveness: an endoparasite lives inside the host's body; an ectoparasite lives outside, on the host's surface. 66ace64486 The use of common names has led to many colloquial expressions for Ixodes holocyclus. The most generally accepted name is Australian paralysis tick or simply paralysis tick. The following table gives some of the other names used to describe various stages of Ixodes holocyclus. 66ace64486 Paralysis ticks are found in many types of habitat, particularly areas of high rainfall such as wet sclerophyll forest and temperate rainforest. The natural hosts for the paralysis tick include koalas, bandicoots, possums and kangaroos. 66ace64486 The host usually delivers a comedic monologue toward the start of the show and then performs in sketches with the cast, and introduces featured performances by a musical guest. An episode normally begins with a cold open sketch that is usually based on current political or pop cultural events and ends with someone breaking character and proclaiming, "Live from New York, it's Saturday Night!", before moving to credits and introduction of the guest host. 66ace64486 Babesia species infect livestock worldwide, wild and domestic vertebrate animals, and occasionally humans, where they cause the disease babesiosis. In the United States, B. microti is the most common strain of the few that have been documented to cause disease in humans. 66ace64486

Parasitism Parasites include single-celled protozoans such as the agents of malaria, sleeping sickness, and amoebic dysentery; animals such as hookworms, lice, mosquitoes, and vampire bats; fungi such as honey fungus and the agents of ringworm; and plants such as mistletoe, dodder, and the broomrapes. of parasitoids, are much smaller than their hosts, do not kill them, and often live in or on their hosts for an extended period. Parasites of animals Parasitism is a close relationship between species, where one organism, the parasite, lives (at least some of the time) on or inside another organism, the host, causing it some harm, and is adapted structurally to this way of life 66ace64486

Lyme disease It is Lyme disease, also known as Lyme borreliosis, is a tick-borne disease caused by species of *Borrelia* bacteria, transmitted by blood-feeding ticks in the genus *Ixodes*. Infection is treatable with antibiotics. Early detection and prompt treatment are associated with more favorable outcomes. It is the most common disease spread by ticks in the Northern Hemisphere. For some patients, recovery may not be immediate or complete, resulting in long-term effects. Most treated patients experience a full recovery. Infections are most common in the spring and early summer. known as Lyme borreliosis, is a tick-borne disease caused by species of *Borrelia* bacteria, transmitted by blood-feeding ticks in the genus *Ixodes* 66ace64486

Flea Fleas live by ingesting the blood of their hosts. Some species can leap 50 times their body length, a feat second only to jumps made by another group of insects, the superfamily of froghoppers. They lack wings; their hind legs are extremely well adapted for jumping. Their claws keep them from being dislodged, and their mouthparts are adapted for piercing skin and sucking blood. Adult fleas grow to about 3 millimetres (1/8 inch) long, are usually dark in color, and have bodies that are "flattened" sideways or narrow, enabling them to move through their hosts' fur or feathers. small flightless insects that live as external parasites of mammals and birds. Flea larvae are worm-like, with no limbs; they have chewing mouthparts and feed on organic debris left on their hosts' skin. Fleas live by ingesting the blood of their hosts. Adult fleas grow to about Flea, the common name for the order Siphonaptera, includes 2,500 species of small flightless insects that live as external parasites of mammals and birds 66ace64486

Ticks belong to two major families: the Ixodidae, or hard ticks, and the Argasidae, or soft ticks. *Nuttalliella*, a genus of tick from southern Africa, is the only living member of the family Nuttalliellidae, which represents the most primitive living lineage of ticks. Adults have ovoid/pear-shaped bodies (idiosomas) which become engorged with blood when they feed, and eight legs. Their cephalothorax and abdomen are completely fused. In addition to having a hard shield on their dorsal surfaces, known as the scutum, hard ticks have a beak-like structure at the front containing the mouthparts, whereas soft ticks... 66ace64486
