

Viral Fever Medicine Name

== Symptoms ==

Bolivian hemorrhagic fever Bolivian hemorrhagic fever (BHF), also known as black typhus or Ordog Fever, is a hemorrhagic fever and zoonotic infectious disease endemic to Bolivia

Signs...

Dengue fever Most cases of dengue fever are either asymptomatic. Dengue fever is a mosquito-borne disease caused by dengue virus, prevalent in tropical and subtropical areas

Fever This includes viral, bacterial, and parasitic. (106 to 108 °F). A fever can be caused by many medical conditions ranging from non-serious to life-threatening

The disease is caused by the yellow fever virus and is spread by the bite of an infected mosquito. It infects humans, other primates, and several types of mosquitoes. In cities, it is spread primarily by *Aedes aegypti*, a type of mosquito found throughout the tropics and subtropics. The virus is an RNA virus of the genus *Orthoflavivirus* (full scientific name *Orthoflavivirus flavi*). The disease may be difficult to tell apart from other illnesses, especially in the early stages. To confirm a suspected case, blood-sample testing with a polymerase chain reaction is required.

Scarlet fever Strep throat is usually associated with fatigue and a fever of over 39 °C. in scarlet fever; such symptoms indicate what is more likely a viral infection

Lassa fever Lassa fever, also known as Lassa hemorrhagic fever, is a type of viral hemorrhagic fever caused by the Lassa virus. Many of those infected by the virus

Crimean–Congo hemorrhagic fever Onset of symptoms is less than two weeks following exposure. Symptoms of CCHF may include fever, muscle pains, headache, vomiting, diarrhea, and bleeding into the skin. CCHF is a tick-borne disease. Complications may include liver failure. Crimean–Congo hemorrhagic fever (CCHF) is a viral disease. Survivors generally recover around two weeks after onset. Symptoms of CCHF may include fever, muscle pains, headache, vomiting, diarrhea, and bleeding Crimean–Congo hemorrhagic fever (CCHF) is a viral disease

The causative agent of CCHF is the CCHF virus, which belongs to the genus *Orthonairovirus*. This virus was initially detected in the 1940s, when Soviet troops

and local civilians in Crimea experienced a severe hemorrhagic illness. Decades later, during the 1960s, a similar virus was identified in Kisangani, today in the Democratic Republic of Congo. The two viruses were found to share antigenic properties, leading to their classification under the unified name Crimean-Congo Hemorrhagic Fever Virus (CCHFV). The CCHFV is typically spread by tick bites or close contact with the blood, secretions, organs or other bodily fluids of infected persons or animals. Groups that are at high risk of infection are farmers and those who work in slaughterhouses. The virus can also spread between people via body fluids. Diagnosis can be made by detecting... df6ae7eb62

Viral meningitis fever, sensitivity to light and neck stiffness. [medical citation needed] Most cases of viral. Viruses are the most common cause of aseptic meningitis df6ae7eb62

Viral hemorrhagic fever Viral hemorrhagic fevers cause symptoms ranging from mild to life-threatening, depending on the virus involved, but generally cause internal bleeding that leads to sudden onset of muscle pain, fever, and hypotension. Viral hemorrhagic fevers (VHFs) are a diverse group of infectious diseases characterized by fever and systemic damage to the circulatory system caused Viral hemorrhagic fevers (VHFs) are a diverse group of infectious diseases characterized by fever and systemic damage to the circulatory system caused by RNA viruses. In severe cases, it can cause life-threatening shock and bleeding from internal organs df6ae7eb62

A safe and effective vaccine against yellow fever exists, and some countries require vaccinations for travelers. Other efforts to prevent infection include reducing the population of the... df6ae7eb62

Colorado tick fever It should not. Colorado tick fever (CTF) is a viral infection transmitted from the bite of an infected Rocky Mountain wood tick (*Dermacentor andersoni*) df6ae7eb62

Yellow fever Yellow fever is a viral disease of typically short duration. In most cases, symptoms include fever, chills, loss of appetite, nausea, muscle pains—particularly in the back—and headaches. In about 15% of people, within a day of improving the fever recurs, abdominal pain occurs and liver damage begins, causing yellow skin. If this occurs, the risk of bleeding and kidney problems is increased. Symptoms typically improve within five days. In most cases, symptoms include fever, chills, loss of appetite, nausea, muscle pains—particularly Yellow fever is a viral disease of typically short duration df6ae7eb62

While some VHFs are generally mild, such as nephropathia epidemica (caused by two species of hantavirus), many are debilitating or lethal without treatment. Outbreaks of VHFs tend to have high case fatality rates and disproportionately affect communities with poor health infrastructure. Therefore, the emergence of VHFs is a growing public health concern. VHFs are often zoonoses, meaning they can be transmitted from wild animals to human populations; for instance, the

Lassa arenavirus is spread by mice. Viral hemorrhagic fevers are caused by members of seven families of single-stranded RNA viruses: Arenaviridae, Filoviridae, Flaviviridae, Nairoviridae, Phenuiviridae, Hantaviridae and Peribunyaviridae. df6ae7eb62
