

Pain The Right Lower Abdomen

Management of chest pain is based on the underlying cause. Initial treatment often includes the medications aspirin and nitroglycerin. The response to... acd8025fab == Advantages == acd8025fab Multidetector CT (MDCT) can clearly delineate anatomic structures in the abdomen, which is critical in the diagnosis of internal diaphragmatic and other nonpalpable or unsuspected hernias. MDCT also offers clear detail of the abdominal wall allowing wall hernias to be identified accurately. acd8025fab The majority of back pain is nonspecific and idiopathic. Common underlying mechanisms include degenerative or traumatic changes to the discs and facet joints, which can then cause secondary pain in the muscles and nerves and referred pain to the bones, joints and extremities. Diseases and inflammation of the gallbladder, pancreas, aorta and kidneys may also cause referred pain in the back. Tumors of the vertebrae, neural tissues and adjacent structures can also manifest as back pain. acd8025fab The left lower quadrant includes the left iliac fossa and half of the flank. The equivalent in other animals is left posterior quadrant. The left upper quadrant extends from the umbilical plane to the left ribcage. This is the left anterior quadrant in other animals. The right upper quadrant extends from umbilical plane to the right ribcage. The equivalent in other animals is right anterior quadrant. The right lower quadrant extends from the umbilical plane to the right inguinal ligament. This in other animals is the right posterior quadrant. acd8025fab Common causes of pain in the abdomen include gastroenteritis and irritable bowel syndrome. About 15% of people have a more serious underlying condition such as appendicitis, leaking or ruptured abdominal aortic aneurysm, diverticulitis, or ectopic pregnancy. In a third of cases, the exact cause is unclear. acd8025fab

Abdominal pain pain, also known as a stomach ache, is a symptom associated with both non-serious and serious medical issues. Since the abdomen contains most of the body's vital organs, it can be an indicator of a wide variety of diseases. Given that, approaching the examination of a person and planning of a differential diagnosis is extremely important. Since the abdomen contains most of the body's Abdominal pain, also known as a stomach ache, is a symptom associated with both non-serious and serious medical issues acd8025fab

Back pain It may be classified as neck pain (cervical), middle back pain (thoracic), lower back pain (lumbar) or coccydynia (tailbone or sacral pain) based on the segment affected. An episode of back pain may be acute, subacute or chronic depending on the duration. The lumbar region is the most commonly affected area. Back pain (Latin: dorsalgia) is pain felt in the back. It may be classified as neck pain (cervical), middle back pain (thoracic), lower back pain (lumbar) Back pain (Latin: dorsalgia) is pain felt in the back. Discomfort can radiate to the arms and hands as well as the legs or feet, and may include numbness or weakness in the legs and arms. The pain may be characterized as a dull ache, shooting or

piercing pain or a burning sensation

Quadrants and regions of abdomen The left lower quadrant (LLQ) of the human abdomen is the area left of the midline and below the umbilicus. These terms are not used in comparative anatomy, since most other animals do not stand erect. The quadrants are referred to as the left lower quadrant, left upper quadrant, right upper quadrant and right lower quadrant. The LLQ includes the left iliac fossa. The human abdomen is divided into quadrants and regions by anatomists and physicians for the purposes of study, diagnosis, and treatment. The division into four quadrants allows the localisation of pain and tenderness, scars, lumps, and other items of interest, narrowing in on which organs and tissues may be involved.

Referral of pain Back pain is common; approximately nine of ten adults experience it at some point in their lives, and five in ten working... In most episodes of low back pain a specific underlying cause is not identified or even looked for: the pain is believed to be due to mechanical problems such as muscle or joint strain. If the pain does not go away with conservative treatment or if it is accompanied by "red flag" symptoms such as unexplained weight loss, fever, or significant problems with feeling or movement, further testing may be needed to look for a serious underlying problem. In most cases, imaging tools such as CT scans are not useful or recommended for low back pain that lasts less than 6 weeks (with no red flags) and carry their own risks. Some low back pain is caused by damaged intervertebral... In humans, the abdomen stretches from the thorax at the thoracic diaphragm to the pelvis at the pelvic brim. The pelvic brim stretches from the lumbosacral joint (the intervertebral disc between L5 and S1) to the pubic symphysis and is the edge of the pelvic inlet. The space above this inlet and under the thoracic diaphragm is termed the abdominal cavity. The boundary of the abdominal cavity is the abdominal wall in the front and the peritoneal surface at the rear.

Computed tomography of the abdomen and pelvis It is used frequently to determine stage of cancer and to follow progress. Renal stones, appendicitis, pancreatitis, diverticulitis, abdominal aortic aneurysm, and bowel obstruction are conditions that are readily diagnosed and assessed with CT. abdominal pain (especially of the lower quadrants, whereas ultrasound is the preferred first line investigation for right upper quadrant pain). CT is also the first line for detecting solid organ injury after trauma. It is also a useful test to investigate acute abdominal pain (especially of the lower quadrants, whereas ultrasound is the preferred first line investigation for right upper quadrant pain). Renal stones. Computed tomography of the abdomen and pelvis is an application of computed tomography (CT) and is a sensitive method for diagnosis of abdominal diseases.

Referred pain Local pain in the prostate can radiate referred pain to the abdomen, lower back, and calf. Referred pain, also called reflective pain, is pain perceived at a location other than the site of the painful stimulus. Despite an increasing amount of literature on

the subject, the biological mechanism of referred pain is unknown, although there are several hypotheses. pain in the upper abdomen, the oblique muscles, and the throat. An example is the case of angina pectoris brought on by a myocardial infarction (heart attack), where pain is often felt in the left side of the neck, left shoulder, and back rather than in the thorax (chest), the site of the injury. Referred pain has been described since the late 1880s. The International Association for the Study of Pain has not officially defined the term; hence, several authors have defined it differently acd8025fab

In acute appendicitis, palpation in the left iliac fossa may produce pain in the right iliac fossa. acd8025fab Radiating pain is slightly different from referred pain; for example, the pain related to a myocardial infarction could either be referred or radiating pain from the chest. Referred pain is when the pain is located away from or adjacent to the organ involved; for instance, when a person has pain only in their jaw or left arm, but not in the chest. Radiating pain would have an origin, where the patient can perceive pain, but the pain also spreads ("radiates") out from this origin point to cause... acd8025fab Serious and relatively common causes include acute coronary syndrome such as a heart attack (31%), pulmonary embolism (2%), pneumothorax, pericarditis (4%), aortic dissection (1%) and esophageal rupture. Other common causes include gastroesophageal reflux disease (30%), muscle or skeletal pain (28%), pneumonia (2%), shingles (0.5%), pleuritis, traumatic and anxiety disorders. Determining the cause of chest pain is based on a person's medical history, a physical exam and other medical tests. About 3% of heart attacks, however, are initially missed. acd8025fab == Positioning and environment == acd8025fab

Low back pain The symptoms of low back pain usually improve within a few weeks from the time they start, with 40–90% of people recovered by six weeks. Low back pain may be classified by duration as acute (pain lasting less than 6 weeks), sub-acute (6 to 12 weeks), or chronic (more than 12 weeks). back pain or lumbago is a common disorder involving the muscles, nerves, and bones of the back, in between the lower edge of the ribs and the lower fold Low back pain or lumbago is a common disorder involving the muscles, nerves, and bones of the back, in between the lower edge of the ribs and the lower fold of the buttocks. Pain can vary from a dull constant ache to a sudden sharp feeling acd8025fab

In vertebrates, the abdomen is a large body cavity enclosed by the abdominal muscles, at the front and to the sides, and by part of the vertebral column at the back. Lower ribs can also enclose ventral and lateral walls. The abdominal cavity is continuous with, and above, the pelvic cavity. It is attached to the thoracic cavity by the diaphragm. Structures such as the aorta, inferior vena... acd8025fab

Chest pain Associated symptoms may include pain in the shoulder, arm, upper abdomen, or jaw, along with nausea, sweating, or shortness of breath. Associated symptoms may include pain in the shoulder, arm, upper abdomen, or jaw, along with nausea, sweating, or shortness of breath Chest pain is pain or discomfort in the chest, typically the front of the chest. It may be described as sharp, dull, pressure, heaviness or squeezing. Those with diabetes or the elderly may have less clear symptoms. heaviness or squeezing. Pain due to

insufficient blood flow to the heart is also called angina pectoris. It can be divided into heart-related and non-heart-related pain acd8025fab

Rovsing's sign The phenomenon Rovsing's sign, named after the Danish surgeon Niels Thorkild Rovsing (1862–1927), is a sign of appendicitis. If palpation of the left lower quadrant of a person's abdomen increases the pain felt in the right lower quadrant, the patient is said to have a positive Rovsing's sign and may have appendicitis. increases the pain felt in the right lower quadrant, the patient is said to have a positive Rovsing's sign and may have appendicitis. The phenomenon was first described by Swedish surgeon Emil Samuel Perman (1856–1945) writing in the journal Hygiea in 1904 acd8025fab

Abdomen left lower, right upper, and right lower. [citation needed] Quadrants are also often used in describing the site of an abdominal pain. The abdomen can also An abdomen (also belly or stomach in vertebrates, or metasoma in arthropods) is the front part of the torso between the thorax (chest) and pelvis in humans and in other vertebrates. The area occupied by the abdomen is called the abdominal cavity. In arthropods, it is the posterior tagma of the body; it follows the thorax or cephalothorax acd8025fab

The nine regions offer more detailed anatomy and are delineated by two vertical and two horizontal lines. acd8025fab 2... acd8025fab

Abdominal examination Referred pain: pain produced away from the area being palpated. Auscultation (listening) of the abdomen with a stethoscope. Palpation of the patient's abdomen. In a complete physical examination, the abdominal exam classically follows the respiratory examination and cardiovascular examination. Finally, percussion (tapping) of the patient's abdomen and abdominal organs. An abdominal examination may be performed because the physician suspects a disease of the organs inside the abdominal cavity (including the liver, spleen, large or small intestines), or simply as a part of a complete physical examination for other conditions. Percussion can be performed in all four quadrants of the abdomen and An abdominal examination is a portion of the physical examination which a physician or nurse uses to clinically observe the abdomen of a patient for signs of disease. The abdominal examination is conventionally split into four different stages: first, inspection of the patient and the visible characteristics of their abdomen. Rebound: pain on release. Depending on the need to test for specific diseases such as ascites, special tests may be performed as a part of the physical examination acd8025fab
