

Is Human Papilloma Virus Curable

The study of reproductive medicine is thought to date back to Aristotle, where he came up with the “Haematogenous Reproduction Theory”. However, evidence-based reproductive medicine is traceable back to the 1970s. Since then, there have been many milestones for reproductive medicine, including the birth of Louise Brown, the first baby to be conceived through IVF in 1978. Despite this, it was not until 1989 that it became a clinical discipline thanks to the work of Iain Chalmers in developing the systematic review and the Cochrane collection. growth typically resulting in tumors with the potential to invade or spread to other parts of the body c6c2e09062

Syphilis is most commonly spread through sexual activity. It may also be transmitted from mother to baby during pregnancy or at birth, resulting in congenital syphilis. Other diseases caused by *Treponema* bacteria include yaws (*T. pallidum* subspecies *pertenue*), pinta (*T. carateum*), and nonvenereal endemic syphilis (*T. pallidum* subspecies *endemicum*). These three diseases... c6c2e09062

Reproductive medicine has allowed the development of artificial reproductive techniques (ARTs) which have allowed advances in overcoming human infertility, as well as being used in agriculture and in wildlife conservation. Some examples of ARTs include IVF, artificial insemination (AI) and embryo transfer, as well as genome resource banking. c6c2e09062

History of medicine The long-known vaccine against Smallpox finally eradicated the The history of medicine is both a study of medicine throughout history as well as a multidisciplinary field of study that seeks to explore and understand medical practices, both past and present, throughout human societies. infections such as measles, mumps, several strains of influenza and human papilloma virus c6c2e09062

Syphilis The signs and symptoms depend on the stage it presents: primary, secondary, latent or tertiary. In secondary syphilis, a diffuse rash occurs, which frequently involves the palms of the hands and soles of the feet. The primary stage classically presents with a single chancre (a firm, painless, non-itchy skin ulceration usually between 1 cm and 2 cm in diameter), though there may be multiple sores. Latent syphilis has no symptoms and can last years. This is believed to be partly due to unsafe drug use, increased Syphilis () is a sexually transmitted infection caused by the bacterium

Treponema pallidum subspecies *pallidum*. Syphilis has been known as "the great imitator", because it may cause symptoms similar to many other diseases. In tertiary syphilis, there are gummas (soft, non-cancerous growths), neurological problems, or heart symptoms. There may also be sores in the mouth or vagina. millennium in many countries, often in combination with human immunodeficiency virus (HIV)

Cervical intraepithelial neoplasia Tzanakakis G, Spandidos DA, Drakoulis N, Tsatsakis AM (March 2018). "Human papilloma virus: Apprehending the link with carcinogenesis and unveiling new research Cervical intraepithelial neoplasia (CIN), also known as cervical dysplasia, is the abnormal growth of cells on the surface of the cervix that could potentially lead to cervical cancer. More specifically, CIN refers to the potentially precancerous transformation of cells of the cervix

Is Human Papilloma Virus Curable

CIN most commonly occurs at the squamocolumnar junction of the cervix, a transitional area between the squamous epithelium of the vagina and the columnar epithelium of the endocervix. It can also occur in vaginal walls and vulvar epithelium. CIN is graded on a 1–3 scale, with 3 being the most abnormal (see classification section below). c6c2e09062 About 33% of deaths from cancer are caused by tobacco and alcohol, obesity, lack of fruit and vegetables in the diet and lack of exercise. Other factors include certain infections, exposure to ionizing radiation, and environmental pollutants. Infection with specific viruses, bacteria, and parasites causes approximately 16–18% of cancers worldwide. These infectious agents include *Helicobacter pylori*, hepatitis B, hepatitis C, and HPV. Human immunodeficiency virus (HIV) does not directly cause cancer, but it causes immune deficiency that can increase the risk of cancer from other infections, sometimes up to several thousandfold. Vaccination against the hepatitis B virus and the human papillomavirus have been

shown to nearly eliminate the risk of cancers caused by these viruses. c6c2e09062 == History == c6c2e09062

Cervical cancer Later symptoms may include abnormal vaginal bleeding, pelvic pain or pain during sexual intercourse. 33 (3): 399–400. It is due to the abnormal growth of cells that can invade or spread to other parts of the body. doi:10 Cervical cancer is a type of cancer that develops in the cervix, the lower narrow part of the uterus (womb). While bleeding after sex may not be serious, it may also indicate the presence of cervical cancer. Experimental Biology and Medicine. Early on, typically no symptoms are seen. (1935). "Carcinoma in the Cottontail Rabbit Following Spontaneous Virus Papilloma (Shope)" c6c2e09062

Almost all cases (99%) are linked to genital human papillomavirus infection (HPV); most who have had HPV infections, however, do not develop cervical cancer. The risk

Is Human Papilloma Virus Curable

is higher in people who smoke, have a weakened immune system, use birth control, start sex at a young age and have many sexual partners. Cervical cancer typically develops from precancerous changes over 10 to 20 years. About 75% of cervical cancers are squamous cell carcinomas, 20-25% are adenocarcinoma. Diagnosis is typically by cervical screening followed by a biopsy. Medical imaging is then done to determine whether or not the cancer has spread beyond the cervix. Like other intraepithelial neoplasias, CIN is not cancer and is usually curable. Most cases of CIN either remain stable or are eliminated by the person's immune system without need for intervention. However...

commonly from nearby structures such as fallopian tubes or the inner lining of the abdomen. When these cells become abnormal, they can divide and form tumors. blood, presence of inclusion ovarian cysts, and infection with human papilloma virus (the cause of some cases of cervical cancer), have been disproven Ovarian cancer is a cancerous tumor of an ovary. These symptoms may include bloating, vaginal bleeding, pelvic pain, abdominal swelling, constipation, and loss of appetite, among others. These cells can also invade or metastasize (spread) to other parts of the body. The ovary is made up of three different cell types including epithelial cells, germ cells, and stromal cells. Common areas to which the cancer may spread include the lining of the abdomen, lymph nodes, lungs, and liver. When this process begins, there may be no or only vague symptoms. Symptoms become more noticeable as the cancer progresses c6c2e09062

The history of medicine is the study and documentation of the
