

Average Height Of Asian Male

WHR is a measure of the distribution of body fat. Higher values of WHR indicate higher risk of obesity-related cardiovascular diseases, which are correlated with both total fat mass (adiposity) and abdominal obesity.

Height in sports Height can significantly influence success in sports, depending on how the design of the sport is linked to factors that are height-biased due to physics Height can significantly influence success in sports, depending on how the design of the sport is linked to factors that are height-biased due to physics and biology. The balance of the intricate array of links will determine the degree to which height plays a role in success, if any

The Indian elephant is native to mainland Asia with nearly three-fourth of the population in India. It also occurs in Nepal, Bangladesh, Bhutan and Southeast Asian countries including Myanmar, Thailand, Malaysia, Laos, Cambodia, and Vietnam with a small population in China. It inhabits grasslands, dry deciduous, moist deciduous, evergreen and semi-evergreen forests across the range. It is classified as a megaherbivore and consumes up to 150 kg (330 lb) of plant matter per day. Its diet depends on the habitat and seasons and includes leaves and twigs of fresh foliage, thorn-bearing... == Advantages == The notion of greater male variability—at least in respect to physical characteristics—can be traced back to the writings of Charles Darwin. When he expounded his theory of sexual selection in *The Descent of Man and Selection in Relation to Sex*, Darwin cites some observations made by his contemporaries. For example, he highlights findings from the Novara Expedition of 1861–1867 where "a vast number of measurements of various parts of the body in different races were made, and the men were found in almost every case to present a greater range of variation than... == Taxonomy == The Asian elephant is distributed in the Indian subcontinent and Southeast Asia, from India in the west to Borneo in the east, and Nepal in the north to Sumatra in the south. It inhabits grasslands, tropical evergreen forests, semi-evergreen forests, moist deciduous forests, dry deciduous forests and dry thorn forests. It is herbivorous, eating about 150

kg (330 lb) of vegetation per day. Cows and calves form groups, while males... In many cases, humans subconsciously attribute positive characteristics, such as intelligence and honesty, to physically attractive people, a psychological phenomenon called the halo effect. Research done in the United States and United Kingdom found that objective measures of physical attractiveness and intelligence are positively correlated, and that the association between the two attributes is stronger among men than among women. Evolutionary psychologists have tried to answer why individuals who are more physically attractive should also, on average, be more intelligent, and have put forward the notion that both general intelligence and physical attractiveness may...

Variability hypothesis A later The variability hypothesis, also known as the greater male variability hypothesis, is the hypothesis that human males generally display greater variability in traits than human females do. females of the same age, height, and body composition, there is much more variation in total, activity, and basal energy expenditure among males

The Asian house martin was first formally described from a bird collected in Borneo by French naturalist and ornithologist Charles Lucien Bonaparte in 1850 as *Chelidon dasypus*, shortly before it was moved to the new genus *Delichon* by British entomologist Frederic Moore and American naturalist... In 1996, WHtR was first suggested by Ashwell and Cole as a simple health risk assessment tool because "it was identified as a proxy for harmful central adiposity since WHtR was correlated with abdominal CT scan". A boundary value of 0.5 was proposed to indicate increased risk. A WHtR of over 0.5 signifies an increased risk; a 2010 systematic review of published studies concluded that "WHtR may be advantageous because it avoids the need for age-, sex- and ethnic-specific boundary values". == Individual surveys and studies ==

Physical attractiveness Physical attraction includes universal perceptions common across human cultures, such as facial symmetry, as well as socioculturally dependent attributes, and personal preferences unique to each individual. above average height. Many factors influence one person's attraction to another, with physical aspects being one of them. The term often implies sexual attractiveness or desirability but can also be distinct. While women usually desire men to be at least the same height as themselves or taller, several other factors also

determine male attractiveness Physical attractiveness is the extent to which a person's physical features are considered aesthetically pleasing or beautiful fa90e29b93

== Early history == fa90e29b93 When populations share genetic backgrounds and environmental factors, average height is frequently characteristic within the group. Exceptional height variation (around 20% deviation from average... fa90e29b93 This martin breeds in colonies, building mud nests under an overhang on a vertical cliff or the wall of a building. Both sexes build the nest, incubate the three or four white eggs and feed the chicks. The Asian house martin feeds on small insects taken in flight, usually caught high in the air. The presence of terrestrial springtails and Lepidoptera larvae in its diet indicates that food is sometimes picked from the ground. fa90e29b93

Human height by country With regard to the table, original studies and sources should be consulted for details on methodology and the exact populations measured, surveyed, or considered. With regard to the table, original studies and sources Below is a table which reports the average adult human height by country or geographical region. Below is a table which reports the average adult human height by country or geographical region fa90e29b93

According to World Health Organization guidance, the waist circumference is usually measured midway between the lower rib and the iliac crest. fa90e29b93 == History == fa90e29b93 It has often been discussed in relation to human cognitive ability, where some studies appear to show that males are more likely than females to have either very high or very low IQ test scores. In this context, there is controversy over whether such sex-based differences in the variability of intelligence exist, and if so, whether they are caused by genetic differences, environmental conditioning, or a combination of both. fa90e29b93

Human height average male curve continues for approximately 3 more years, going to zero at about 18–19, although there is limited research to suggest minor height Human height or stature is the distance from the bottom of the feet to the top of the head in a human body, standing erect. In the early phase of anthropometric research history, questions about height measuring techniques for measuring nutritional status often concerned genetic differences. It is measured using a stadiometer, in centimetres when using the metric system or SI system, or feet and inches when using United States customary units or the imperial system fa90e29b93

Asian house martin Its three subspecies breed in the Himalayas and in central and eastern Asia, and spend the winter lower in the mountains or in Southeast Asia. The preferred habitat of the Asian house martin The Asian house martin (*Delichon dasypus*) is a migratory passerine bird of the swallow family Hirundinidae. This species is locally abundant and is expanding northward in Siberia, so there are no concerns about its conservation status. It has mainly blue-black upperparts, other than its white rump, and has pale grey underparts. altitudes. The height separation and the small differences in appearance seem sufficient to prevent interbreeding fa90e29b93

Asian openbill It is greyish or white with glossy black wings and tail. Young birds are born without this gap. This distinctive stork is found The Asian openbill or Asian openbill stork (*Anastomus oscitans*) is a large wading bird in the stork family Ciconiidae. Although resident within their range, they make long distance movements in response to weather and food availability. The Asian openbill or Asian openbill stork (*Anastomus oscitans*) is a large wading bird in the stork family Ciconiidae. Adults have a gap between the arched upper mandible and recurved lower mandible which is thought to be an adaptation that aids in the handling of snails, their main prey. This distinctive stork is found mainly in the Indian subcontinent and Southeast Asia fa90e29b93

Height is also important because it is closely correlated with other health components, such as life expectancy. Studies show that there is a correlation between small stature and a longer life expectancy. Individuals of small stature are also more likely to have lower blood pressure and are less likely to acquire cancer. The University of Hawaii has found that the "longevity gene" FOXO3 that reduces the effects of aging is more commonly found in individuals of small body size. Short stature decreases the risk of venous insufficiency. fa90e29b93

Waist-to-height ratio The waist-to-height ratio (WHtR, or WSR: waist-to-stature ratio) is the waist circumference divided by body height, both measured in the same units. WHtR The waist-to-height ratio (WHtR, or WSR: waist-to-stature ratio) is the waist circumference divided by body height, both measured in the same units fa90e29b93

Indian elephant It has a broader skull with a concave forehead, two large laterally folded ears and a large trunk. It has a convex back and the highest body point on its head, exhibits significant sexual dimorphism with a male reaching an average shoulder height of about 2. 75 m (9 ft 0 in) and weighing 4,000 kg

(8,800 lb). A female reaches an average shoulder height of about 2.4 m (7 ft 10 in) and weighs 2,700 kg (6,000 lb). It has smooth grey skin with four large legs and a long tail. 75 m (9 ft 0 in) and weighing 4,000 kg (8,800 lb). male reaching an average shoulder height of about 2. A female reaches an average shoulder height of The Indian elephant (*Elephas maximus indicus*) is one of three extant recognized subspecies of the Asian elephant, native to mainland Asia fa90e29b93

== Taxonomy == fa90e29b93

Asian elephant 4 short tons) in weight and females 2. m. 4 The Asian elephant (*Elephas maximus*), also known as the Asiatic elephant, is the only living species in the genus *Elephas*. m. m. 0 short tons). Adult males average 4 t (4. It is the largest living land animal in Asia and the second largest living elephantid in the world. It is characterised by its long trunk with a single finger-like process; large tusks in males; laterally folded large ears and wrinkled grey skin that is partly depigmented on the trunk, ears or neck. Three subspecies are recognised—*E. indicus* and *E. maximus*, *E. sumatranus*. It has a large and well developed neocortex of the brain, is highly intelligent and self-aware, being able to display behaviours associated with grief, learning and greeting fa90e29b93
