

Abdomen Tenderness Left Side

McBurney's point McBurney's point is the point over the right side of the abdomen that is one-third of the distance from the anterior superior iliac spine to the umbilicus. McBurney's point is the point over the right side of the abdomen that is one-third of the distance from the anterior superior iliac spine to the umbilicus (navel). This is near the most common location of the appendix.

Epiploic appendagitis The pain is typically located in the right or left lower Epiploic appendagitis (EA) is an uncommon, benign, self-limiting inflammatory process of the epiploic appendices. Other, older terms for the process include appendicitis epiploica and appendagitis, but these terms are used less now in order to avoid confusion with acute appendicitis. have tender abdomens as a symptom. Symptoms do not include fever, vomiting, or leukocytosis.

Abdominal trauma Signs and symptoms include abdominal pain, tenderness, rigidity, and bruising of the external abdomen. is an injury to the abdomen. Complications may include

Abdominal examination An abdominal examination may be performed because the physician suspects a disease of the organs inside the abdominal cavity (including the liver, spleen, large or small intestines), or simply as a part of a complete physical examination for other conditions. In a complete physical examination, the abdominal exam classically follows the respiratory examination and cardiovascular examination. Auscultation (listening) of the abdomen with a stethoscope. The abdominal examination is conventionally split into four different stages: first, inspection of the patient and the visible characteristics of their abdomen. Palpation of the patient's abdomen. lower abdominal quadrant on palpation of the left side of the abdomen McBurney's sign - deep tenderness at McBurney's point Carnett's sign - pain when An abdominal examination is a portion of the physical examination which a physician or nurse uses to clinically observe the abdomen of a patient for signs of disease. Depending on the need to test for specific diseases such as ascites, special tests may be performed as a part of the physical examination. Finally, percussion (tapping) of the patient's abdomen and abdominal organs.

Spleen pain Spleen pain is a pain felt from the left upper quadrant of the abdomen or epigastrium where the human spleen is located or neighboring. Splenomegaly can Spleen pain is a pain felt from the left upper quadrant of the abdomen or epigastrium where the human spleen is located or neighboring.

== Referral of pain == The nine regions offer more detailed anatomy and are delineated by two vertical and two horizontal lines.

Abdomen rear. In arthropods, it is the posterior tagma of the body; it follows the thorax or cephalothorax. In vertebrates, the abdomen is a large body cavity enclosed by the abdominal muscles, at the front and to the sides, and by part of the vertebral column. An abdomen (also belly or stomach in vertebrates, or metasoma in arthropods) is the front part of the torso between the thorax (chest) and pelvis in humans and in other vertebrates. The area occupied by the abdomen is called the abdominal cavity.

In vertebrates, the abdomen is a large body cavity enclosed by the abdominal muscles, at the front and to the sides, and by part of the vertebral column at the back. Lower ribs can also enclose ventral and lateral walls. The abdominal cavity is continuous with, and above, the pelvic cavity. It is attached to the thoracic cavity by the diaphragm. Structures such as the aorta, inferior vena cava, and abdominal aorta pass through it. Although it is self-limiting, epiploic appendagitis can cause severe pain.

Rovsing's sign If palpation of the left lower quadrant of a person's abdomen increases the pain felt in the right lower quadrant, the patient is said to have a positive Rovsing's sign and may have appendicitis. explanation: This maneuver elicits tenderness in the right lower abdomen, because contents of the left lower abdomen are shifted upon application of pressure. Rovsing's sign, named after the Danish surgeon Niels Thorkild Rovsing (1862–1927), is a sign of appendicitis. The phenomenon was first described by Swedish surgeon Emil Samuel Perman (1856–1945) writing in the journal Hygiea in 1904.

Epiploic appendices are small, fat-filled sacs or finger-like projections along the surface of the upper and lower colon and rectum. They may become acutely inflamed as a result of torsion (twisting) or venous thrombosis. The inflammation causes pain, often described as sharp or stabbing, located on the left, right, or central regions of the abdomen. There is sometimes nausea and vomiting. The symptoms may mimic those of acute appendicitis, diverticulitis, or cholecystitis. The pain is characteristically intense during/after defecation or micturition (espec. in the sigmoid type) due to the effect of traction on the pedicle of the lesion caused by straining and emptying of the bowel and bladder. Initial lab studies are usually normal. EA is usually diagnosed incidentally on CT scan which is performed to exclude more serious conditions.

Pampiniform plexus The vein, which opens on the right side into the inferior vena cava, at an acute angle, and on the left side into the left renal vein, at a right angle.

Location The left lower quadrant includes the left iliac fossa and half of the flank. The equivalent in other animals is left posterior quadrant. The left upper quadrant extends

from the umbilical plane to the left ribcage. This is the left anterior quadrant in other animals. The right upper quadrant extends from umbilical plane to the right ribcage. The equivalent in other animals is right anterior quadrant. The right lower quadrant extends from the umbilical plane to the right inguinal ligament. This in other animals is the right posterior quadrant. 65bac0670f McBurney's point is located one third of the distance from the right anterior superior iliac spine to the umbilicus (navel). This point roughly corresponds to the most common location of the base of the appendix, where it is attached to the cecum. 65bac0670f In acute appendicitis, palpation in the left iliac fossa may produce pain in the right iliac fossa. 65bac0670f

Quadrants and regions of abdomen These terms are not used in comparative anatomy, since most other animals do not stand erect. The quadrants are referred to as the left lower quadrant, left upper quadrant, right upper quadrant and right lower quadrant. The division into four quadrants allows the localisation of pain and tenderness, scars, lumps, and other items of interest, narrowing in on which organs and tissues may be involved. On the sides of the abdomen the other six regions are the left and right hypochondriac regions, on either side of the epigastrium; the left and right The human abdomen is divided into quadrants and regions by anatomists and physicians for the purposes of study, diagnosis, and treatment 65bac0670f

In humans, the abdomen stretches from the thorax at the thoracic diaphragm to the pelvis at the pelvic brim. The pelvic brim stretches from the lumbosacral joint (the intervertebral disc between L5 and S1) to the pubic symphysis and is the edge of the pelvic inlet. The space above this inlet and under the thoracic diaphragm is termed the abdominal cavity. The boundary of the abdominal cavity is the abdominal wall in the front and the peritoneal surface at the rear. 65bac0670f
