Because the purpose of red blood cells is to transfer oxygen from the lungs to body tissues, a blood sample's hematocrit—the red blood cell volume percentage—can become a point of reference of its capability of delivering oxygen. Hematocrit levels that are too high or too low can indicate a blood disorder, dehydration, or other medical conditions. An abnormally low hematocrit may suggest anemia, a decrease in the total amount of red blood cells, while an abnormally high hematocrit is called polycythemia. Both are potentially life-threatening disorders. fb328ff40e According to Deloitte - perhaps have a pre-amble as to what Deloitte is Best Wishes, Lee Vilenski 16:03, 18 August 2020 (UTC)reply fb328ff40e

Anemia in pregnancy Anemia is an extremely common condition in pregnancy world-wide, conferring a number of health risks to mother and child. Anemia in pregnancy is a decrease in the total red blood cells (RBCs) or hemoglobin in the blood during pregnancy. Maternal signs and symptoms are usually non-specific, but can include: fatigue, pallor, dyspnea, palpitations, and dizziness. the blood), red cell distribution width (RDW), reticulocyte count, and a peripheral smear to assess red blood cell morphology. There are numerous well-known maternal consequences of anemia including: maternal cardiovascular strain, reduced physical and mental performance, reduced peripartum blood reserves, increased risk for peripartum blood product transfusion, and increased risk for maternal mortality. While anemia in pregnancy may be pathologic, in normal pregnancies, the increase in RBC mass is smaller than the increase in plasma volume, leading to a mild decrease in hemoglobin concentration referred to as physiologic (or dilutional) anemia. If iron deficiency is suspected Anemia is a condition in which blood has a lower-than-normal amount of red blood cells or hemoglobin fb328ff40e

The 1988 Football League Second Division play-off Final was a rather dull pair of football matches which promoted Middlesbrough to the top tier of English football, then known as the First Division. What livened things up somewhat was the hooliganism after the second leg: a few hundred Chelsea fans invaded the pitch and attacked the Middlesbrough fans, who were still penned in. The police were criticised for being slow to react, but mopped everything up. There were 45 injuries and over 100 arrests. English football, which was suffering from a poor reputation for this sort of thing, took another hit. It was the final nail in the coffin for English clubs chances of being readmitted to European club competition early, and they had to wait another two seasons. A joint nomination with the playoff wizard himself, TRM. As always, all thoughts, criticisms and comments will be greatly appreciated. Harrias 20:49, 29 July 2020 (UTC)reply fb328ff40e Sure. The Rambling Man (Hands! Face! Space!!!!) 21:22, 18 August 2020 (UTC)reply fb328ff40e A reference range is usually defined as the set of values 95 percent of the normal population falls within (that is, 95% prediction interval). It is determined by collecting data from vast numbers of laboratory tests. fb328ff40e In total, 102 arrests were made - for the lead, can we just say "over 100 arrests?"
