Otitis externa may be acute (lasting less than six weeks) or chronic (lasting more than three months). Acute cases are typically due to bacterial infection, and chronic cases are often due to allergies and autoimmune disorders. The most common cause of otitis externa is bacterial. Risk factors for acute cases include swimming, minor trauma from cleaning, using hearing aids and ear plugs, and other skin problems, such as psoriasis and dermatitis. People with diabetes are at risk of a severe form of malignant otitis externa. Diagnosis is based on the signs and symptoms. Culturing the ear canal may be useful in chronic or severe cases.

For this reason, TV Ears are legally able to have a volume of 120 decibels. Using digital technology, known as Voice Clarifying Circuitry, the headsets work to automatically and exponentially increase the gain on high frequency sounds. This works to make the words appear clearer from audio tracks that are on television programs or movies. Unlike traditional headphones, TV Ears are worn under the listener's chin where they hook to the ears. That box similarly has a tapper for communicating back, so boxes have keys each of which rings the bell in a neighbouring box. The bells sound different tones, so that the signalman can tell them apart by ear. (The bell system is not used in modern power signal boxes, other than to any older adjacent signalboxes.) Each such signal box has a bell circuit to the boxes on either side of it along the line. Middle ear barotrauma Tympanic rupture during a dive can allow water into the middle ear, which can cause severe vertigo from caloric stimulation. It is common in underwater divers and usually occurs when the diver does not equalise sufficiently during descent or, less commonly, on ascent. Unequalised ambient pressure increase during descent causes a pressure imbalance between the middle ear air space and the external auditory canal over the eardrum, causing inward stretching, serous effusion and haemorrhage, and eventual rupture. Failure to equalise may be due to inexperience or eustachian tube dysfunction, which can have many possible causes. This may cause nausea and vomiting. This damage causes local pain

Unequal pressures in the middle ears can cause alternobaric vertigo, disorientation Middle ear barotrauma (MEBT), also known to underwater divers as ear squeeze and reverse ear squeeze, is injury caused by a difference in pressure between the external ear canal and the middle ear. During ascent internal over-pressure is normally passively released through the eustachian tube, but if this does not happen the volume expansion of middle ear gas will cause outward bulging, stretching and eventual rupture of the eardrum known to divers as reverse ear squeeze 6cbbf7fc38
