Fluticasone furoate/umeclidinium bromide/vilanterol The medications work in different ways: fluticasone furoate is an inhaled corticosteroid (ICS), umeclidinium is a long-acting muscarinic antagonist (LAMA), and vilanterol is a long-acting beta-agonist (LABA). FF/UMEC/VI exists as a dry-powder inhaler, which means that the force of the user's breath causes the medicated powder to leave the device and enter the lungs. Fluticasone furoate/umeclidinium bromide/vilanterol, sold under the brand name Trelegy Ellipta among others, is a fixed-dose combination inhaled medication that is used for the maintenance treatment of chronic obstructive pulmonary disease (COPD).

In standard medicine, the most frequent uses of enemas are to relieve constipation and for bowel cleansing before a medical examination or procedure; also, they are employed as a lower gastrointestinal series (also called a barium enema), to treat traveler's diarrhea, as a vehicle for the administration of food, water or medicine, as a stimulant to the general system, as a local application and, more rarely, as a means of reducing body temperature, as treatment for encopresis, and as a form of rehydration therapy (proctoclysis) in patients for whom intravenous therapy is not applicable. Omacetaxine approval in US is discontinued (August 2024)[1][2] and is no longer recommended for treatment of CML (as of NCCN CML guidance 3. 2025) [3] cc5e9b6f3d

Baby colic excessively turn out to have an underlying organic disease, such as constipation, gastroesophageal reflux disease, lactose intolerance, anal fissures Baby colic, also known as infantile colic, is defined as episodes of crying for more than three hours a day, for more than three days a week, for three weeks in an otherwise healthy child. Often crying occurs in the evening. It typically does not result in long-term problems. The crying can result in frustration of the parents, depression following delivery, excess visits to the doctor, and child abuse cc5e9b6f3d

The cause of colic is unknown. Some believe it is due to gastrointestinal discomfort like intestinal cramping. Diagnosis requires ruling out other possible causes. Concerning findings include a fever, poor activity, or a swollen abdomen. Fewer than 5% of infants with excess crying have an underlying organic disease. cc5e9b6f3d HHT is a natural plant alkaloid derived from *Cephalotaxus fortunei*. HHT and related compound esters of cephalotaxine were described first in 1970, and were the subject of intensive research efforts by Chinese investigators to clarify their role as anticancer and antileukemic agents from the 1970s until the present. It was approved by the US FDA in October 2012 for the treatment of adult patients with CML with resistance and/or intolerance to two or more tyrosine kinase inhibitors (TKIs). cc5e9b6f3d The principal medical usages of enemas are:

Macrogol electrolytes, is used for short-term relief of constipation as well as for long-term use in constipation of various causes, including in people with multiple sclerosis Macrogol is the international nonproprietary name used for polyethylene glycol (PEG) as a medication ingredient. Small amounts of Macrogol are also occasionally used similarly to baby laxative, as an excipient. Macrogol is used as a laxative to treat constipation in children and adults. It is usually followed by a number indicating the average molecular weight, indicating the length of the polymer of the specific molecule in use. It is orally administered, with a resultant bowel movement typically occurring within a few days. A much larger dose of Macrogol is administered to clear the bowels, as preparation prior to a colonoscopy; the onset of the laxative effect is more rapid at this dosage, with onset of action typically occurring within an hour and lingering effects lasting for up to a few days cc5e9b6f3d

Macrogol side effects may include increased flatulence, abdominal pain, and nausea. Rare but serious side effects may include an abnormal heartbeat, seizures, and kidney problems. Moderate usage appears to be safe during pregnancy. It is classified as an osmotic laxative: It works by increasing the amount of water in the stool. cc5e9b6f3d
Azacitidine is indicated for the treatment of myelodysplastic syndrome, for which it received approval by the U.S. Food and Drug Administration (FDA) on 19 May 2004. In two randomized controlled trials comparing azacitidine to supportive treatment, 16% of subjects with myelodysplastic syndrome who were randomized to receive azacitidine had a complete or partial normalization of blood cell counts and bone marrow morphology, compared to none who received supportive care, and about two-thirds of patients who required blood transfusions no longer needed them after receiving azacitidine.
